Introduction

Thank you for purchasing your 651R or 751R AV Receiver. We are confident that you will enjoy many years of listening pleasure from it. Like all Cambridge Audio products the 651R/751R adheres to our three core principles – stunning performance, ease of use and incredible value.

As such, the seven audiophile grade fully discrete class AB amplifiers are kept as separate as possible from the processing and input stages and feature a large power supply with a low flux toroidal transformer. This careful design of the amplifier stages ensures that the 651R/751R can reproduce the dynamics and scale required for modern movie soundtracks whilst also being able to reproduce a genuinely musical performance with either stereo or multichannel music sources.

A full range of HDMI, digital and analogue inputs are fitted. These allow the connection of suitably equipped Blu-ray players, DVD players, satellite/set-top boxes and games consoles for decoding into stereo, stereo + sub or various digital surround formats.

The latest formats are supported including Dolby True HD, Dolby Digital Plus, DTS-HD Master Audio and DTS-HD High Resolution Audio in 5.1 or 7.1 variants. In particular, support for the true lossless Dolby True HD and DTS-HD Master Audio formats provides unprecedented audio fidelity from Blu-ray discs.

Various HDMI 1.4 features are supported including 3D TV and deepColour pass-through from suitable sources and Audio Return from TVs with this feature.

The 651R/751R is also capable of decoding encoded analogue or digital stereo sources in Dolby Pro Logic® II or IIX and DTS Neo:6, for a convincing and effective surround experience from a matrix encoded stereo source. Sophisticated post-processing of 5.1 digital material is also possible with Dolby Pro Logic IIX or DTS Neo:6 to turn these formats into 7.1.

Alternatively Dolby Pro Logic IIX processing allows height channel generation from Stereo or 5.1/7.1 material for an alternative 5.1 + Height presentation.

Conventional analogue stereo inputs allow the connection of audiophile CD players and the like, and an Analogue Stereo Direct mode with no processing ensures the very best possible stereo reproduction for these.

The 651R/751R also carries a 5.1/7.1 channel analogue input. This feature allows for the connection of a DVD-Audio or SACD player equipped with a 5.1 output and is compatible with any future external 7.1 audio formats.

As well as the full complement of audio inputs, the 651R/751R performs Composite, S-Video, Component Video and HDMI switching with transcoding and scaling (up-converting) of all analogue video to HDMI.

A Zone 2 output allows the Surround Back Amplifiers to be used to power another Zone if these are not being used for 7.1 output in the Main Zone. Alternatively if you wish to use all 7.1 channels in the Main Zone a separate power amplifier and speakers can be connected to the Zone 2 preamp outputs.

Both Main and Zone 2 remotes are supplied with the 651R/751R. Audyssey 2EQ®, Audyssey Dynamic EQ®, Audyssey Dynamic Volume® with Autosetup help achieve the best performance in your particular room and with your speaker setup.

An RS232 port and IR Emitter In also make it easy to integrate the 651R/751R into a Custom Install situation.

The 651R and 751R share all the extensive features above. The 751R differs from the 651R by being more powerful, having one extra HDMI 1.4 input on the rear and an additional HDMI 1.3 In on the front panel. The 751R also features Anagram Technologies ATF up-sampling on all channels.

This is performed by a third DSP (Digital Signal Processor) over the two used in the 651R which converts all digital audio to 24-bit/192kHz with comprehensive jitter suppression before conversion by the DACs.

Finally the 751R also features a 24 Bit Asynchronous USB Audio input capable of up to 24-bit/192kHz Audio from Mac and PC.

All this proprietary engineering is housed within our low resonance, acoustically damped chassis. An Azur Navigator remote control is also provided, giving full remote control of your AV receiver in an attractive and easy to use handset.

Remember your 651R/751R can only be as good as the system it is connected to. Please do not compromise on your source equipment, speaker package or video and audio cabling. Naturally we particularly recommend Blu-ray players, digital and analogue iPod docks, Network and CD players from the Cambridge Audio Azur range, which have been designed to the same exacting standards as our receivers. Your dealer can also supply excellent quality Cambridge Audio interconnects to ensure your system realises its full potential.

Thanks for taking the time to read this manual, we do recommend you keep it for future reference.

Matthew Bramble
Cambridge Audio Technical Director
and the 651R/751R design team

Before connecting

The process of setting up the 651R/751R is first to make all the connections to your speakers and source equipment and then set the unit up via its On-Screen Display (OSD). There are various settings and adjustments that need to be made before the 651R/751R can be used.

However before you actually decide which connections to make or perform any adjustments it is strongly advised that you read through the ‘651R/751R setup’ section of this manual first, starting on page 18.

A lot of explanation is included that will help you to choose the right connection types for both your sources and TV.
Important safety instructions

For your own safety please read the following important safety instructions carefully before attempting to connect this unit to the mains power supply. They will also enable you to get the best performance from and prolong the life of the unit:

1. Read these instructions.
2. Keep these instructions.
3. Heed all warnings.
4. Follow all instructions.
5. Do not use this apparatus near water.
6. Clean only with a dry cloth.
7. Do not block any ventilation openings. Install in accordance with the manufacturer’s instructions.
8. Do not install near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.
9. Do not defeat the safety purpose of the polarized or grounding-type plug. A polarized plug has two blades with one wider than the other. A grounding-type plug has two blades and a third grounding prong. The wide blade or the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.
10. Protect the power cord from being walked on or pinched, particularly at plugs, convenience receptacles and the point where they exit from the apparatus.
11. Only use attachments/accessories specified by the manufacturer.
12. Use only with the cart, stand, tripod, bracket, or table specified by the manufacturer, or sold with the apparatus. When a cart is used, use caution when moving the cart/apparatus combination to avoid injury from tip-over.
13. Unplug this apparatus during lightning storms or when unused for long periods of time.
14. Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as the power-supply cord or plug having been damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.

WARNING

- To reduce the risk of fire or electric shock, do not expose this unit to rain or moisture.
- Batteries (battery pack or batteries installed) shall not be exposed to excessive heat such as sunshine, fire or the like.

The unit must be installed in a manner that makes disconnection of the mains plug from the mains socket outlet (or appliance connector from the rear of the unit) possible. Where the mains plug is used as the disconnect device, the disconnect device shall remain readily operable. Only use the mains cord supplied with this unit.

Please ensure there is ample ventilation (at least 10cm clearance all round). Do not put any objects on top of this unit. Do not situate it on a rug or other soft surface and do not obstruct any air inlets or outlet grilles. Do not cover the ventilation grilles with items such as newspapers, tablecloths, curtains, etc.

This unit must not be used near water or exposed to dripping or splashing water or other liquids. No objects filled with liquid, such as vases, shall be placed on the unit.

The lightning flash with the arrowhead symbol within an equilateral triangle is intended to alert the user to the presence of un-insulated ‘dangerous voltage’ within the product’s enclosure that may be of sufficient magnitude to constitute a risk of electric shock to persons.

The exclamation point within an equilateral triangle is intended to alert the user to the presence of important operating and maintenance instructions in the service literature relevant to this appliance.

The symbol on this product indicates that it is of CLASS II (double insulated) construction.

The crossed-out wheeled bin is the European Union symbol for indicating separate collection for electrical and electronic equipment. This product contains electrical and electronic equipment which should be reused, recycled or recovered and should not be disposed of with unsorted regular waste. Please return the unit or contact the authorised dealer from whom you purchased this product for more information.

This product complies with European Low Voltage (2006/95/EC), Electromagnetic Compatibility (2004/108/EC) and Environmentally-friendly design of Energy-related Products (2009/125/EC) Directives when used and installed according to this instruction manual. For continued compliance only Cambridge Audio accessories should be used with this product and servicing must be referred to qualified service personnel.

This product meets the Australian Communications Authority’s Radio communications and EMC requirements.

This product meets Russian electronic safety approvals.

NOTE: THE MANUFACTURER IS NOT RESPONSIBLE FOR ANY RADIO OR TV INTERFERENCE CAUSED BY UNAUTHORIZED MODIFICATIONS TO THIS EQUIPMENT. SUCH MODIFICATIONS COULD VOID THE USER AUTHORITY TO OPERATE THE EQUIPMENT.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Re-orient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.
VENTILATION

IMPORTANT – The unit will become hot when in use. Do not stack multiple units on top of each other. Do not place in an enclosed area such as a bookcase or in a cabinet without sufficient ventilation.

Ensure that small objects do not fall through any ventilation grille. If this happens, switch off immediately, disconnect from the mains supply and contact your dealer for advice.

POSITIONING

Choose the installation location carefully. Avoid placing it in direct sunlight or close to a source of heat. No naked flame sources, such as lighted candles, should be placed on the unit. Also avoid locations subject to vibration and excessive dust, cold or moisture. The unit can be used in a moderate climate.

This unit must be installed on a sturdy, level surface. Do not place in a sealed area such as a bookcase or in a cabinet. Any space open at the back (such as a dedicated equipment rack) is fine, however. Do not place the unit on an unstable surface or shelf. The unit may fail, causing serious injury to a child or adult as well as serious damage to the product. Do not place other equipment on top of the unit.

Due to stray magnetic fields, turntables or CRT TVs should not be located nearby due to possible interference.

Electronic audio components have a running in period of around a week (if used several hours per day). This will allow the new components to settle down and the sonic properties will improve over this time.

POWER SOURCES

The unit should be operated only from the type of power source indicated on the marking label. If you are not sure of the type of power-supply to your home, consult your product dealer or local power company.

This unit can be left in Standby mode when not in use and will draw <0.5W in this state. To turn the unit off, switch off at the rear panel. If you do not intend to use this unit for a long period of time, unplug it from the mains socket.

OVERLOADING

Do not overload wall outlets or extension cords as this can result in a risk of fire or electric shock. Overloaded AC outlets, extension cords, frayed power cords, damaged or cracked wire insulation and broken plugs are dangerous. They may result in a shock or fire hazard.

Be sure to insert each power cord securely. To prevent hum and noise, do not bundle the interconnect leads with the power cord or speaker leads.

CLEANING

To clean the unit, wipe its case with a dry, lint-free cloth. Do not use any cleaning fluids containing alcohol, ammonia or abrasives. Do not spray an electronic audio component with any cleaning fluids.

BATTERY DISPOSAL

Batteries may contain substances harmful to the environment. Please dispose of any discharged batteries with due consideration and in accordance with local environmental/electronic recycling guidelines.

LOUDSPEAKERS

Before making any connections to loudspeakers, make sure all power is turned off and only use suitable interconnects.

SERVICING

These units are not user serviceable. Never attempt to repair, disassemble or reconstruct the unit if there seems to be a problem. A serious electric shock could result if this precautionary measure is ignored. In the event of a problem or failure, please contact your dealer.

IMPORTANT

If the unit is run at a very high level, a sensor will detect a temperature rise and show "PROTECTION OVERLOAD" on the display. The unit will then go into Standby mode. It cannot be switched on again until the temperature has fallen to a more normal level.

Limited warranty

Cambridge Audio warrants this product to be free from defects in materials and workmanship (subject to the terms set forth below). Cambridge Audio will repair or replace (at Cambridge Audio's option) this product or any defective parts in this product. Warranty periods may vary from country to country. If in doubt consult your dealer and ensure that you retain proof of purchase.

To obtain warranty service, please contact the Cambridge Audio authorised dealer from which you purchased this product. If your dealer is not equipped to perform the repair of your Cambridge Audio product, it can be returned by your dealer to Cambridge Audio or an authorised Cambridge Audio service agent. You will need to ship this product in either its original packaging or packaging affording an equal degree of protection.

Proof of purchase in the form of a bill of sale or receipted invoice, which is evidence that this product is within the warranty period, must be presented to obtain warranty service.

This Warranty is invalid if (a) the factory-applied serial number has been altered or removed from this product or (b) this product was not purchased from a Cambridge Audio authorised dealer. You may call Cambridge Audio or your local country Cambridge Audio distributor to confirm that you have an unaltered serial number and/or you purchased from a Cambridge Audio authorised dealer.

This Warranty does not cover cosmetic damage or damage due to acts of God, accident, misuse, abuse, negligence, commercial use, or modification of, or to any part of, the product. This Warranty does not cover damage due to improper operation, maintenance or installation, or attempted repair by anyone other than Cambridge Audio or a Cambridge Audio dealer, or authorised service agent which is authorised to do Cambridge Audio warranty work. Any unauthorised repairs will void this Warranty. This Warranty does not cover products sold AS IS or WITH ALL FAULTS.

REPAIRS OR REPLACEMENTS AS PROVIDED UNDER THIS WARRANTY ARE THE EXCLUSIVE REMEDY OF THE CONSUMER. CAMBRIDGE AUDIO SHALL NOT BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES FOR BREACH OF ANY EXPRESS OR IMPLIED WARRANTY IN THIS PRODUCT. EXCEPT TO THE EXTENT PROHIBITED BY LAW, THIS WARRANTY IS EXCLUSIVE AND IN LIEU OF ALL OTHER EXPRESS AND IMPLIED WARRANTIES WHATSOEVER INCLUDING, BUT NOT LIMITED TO, THE WARRANTY OF MERCHANTABILITY AND FITNESS FOR A PRACTICAL PURPOSE.

Some countries and US states do not allow the exclusion or limitation of incidental or consequential damages or implied warranties so the above exclusions may not apply to you. This Warranty gives you specific legal rights, and you may have other statutory rights, which vary from state to state or country to country.

For any service, in or out of warranty, please contact your dealer.

Plug Fitting Instructions (UK Only)

The cord supplied with this appliance is factory fitted with a UK mains plug fitted with a 5 amp fuse inside. If it is necessary to change the fuse, it is important that a 5 amp one is used. If the plug needs to be changed because it is not suitable for your socket, or becomes damaged, it should be cut off and an appropriate plug fitted following the wiring instructions below. The plug must then be disposed of safely, as insertion into a mains socket is likely to cause an electrical hazard. Should it be necessary to fit a 3-pin BS mains plug to the power cord the wires should be fitted as shown in this diagram. The colours of the wires in the mains lead of this appliance may not correspond with the coloured markings identifying the terminals in your plug. Connect them as follows:

- The wire which is coloured BLUE must be connected to the terminal which is marked with the letter ‘N’ or coloured BLACK.
- The wire which is coloured BROWN must be connected to the terminal which is marked with the letter ‘L’ or coloured RED.
- The wire which is coloured GREEN/YELLOW must be connected to the terminal which is marked with the letter ‘E’ or coloured GREEN.

If your model does not have an earth wire, then disregard this instruction.

If a standard 13 amp (BS 1363) plug is used, a 5 amp fuse must be fitted, or if any other type of plug is used a 5 amp fuse must be fitted, either in the plug or adaptor, or on the distribution board.
Front panel controls

1 Standby/On
Switches the unit between Standby mode (indicated by a dim power LED) and On (indicated by a bright power LED). Standby is an eco-friendly <0.5W low power mode. The unit may be left in Standby mode when not in use.

2 Phones
Allows for the connection of stereo headphones with a 6.35mm/¼" Jack plug. Headphones with an impedance of between 32 and 600 ohms are recommended.

Note: Plugging in headphones will automatically mute the main and pre-amp outputs and select a Dolby Headphones output to be created for headphone use.

3 Tuning +/-
Used to tune FM/AM frequencies and skip presets for the built-in Tuner.

4 Mode/Store
Press to cycle between Tuner modes. Press and hold for storing presets (refer to the ‘Operating Instructions’ of this manual for more information).

5 Infrared sensor
Receives IR commands from the supplied remote control. A clear, unobstructed line of sight between the remote control and the sensor is required.

6 Display
Displays the status of the unit.

7 Tuner FM/AM
Press to select the tuner. Once in Tuner mode press to switch between FM and AM modes.

Note: The 651R/751R remembers the audio and video input type and processing mode for each individual source input. These are recalled each time a source is selected.

8 Expansion
Press to select an optional expansion source module connected to the Expansion port at the back of the unit.

9 USB (751R only)
Press to select the USB Audio source connected to the USB input at the back.

10 BD/DVD
Press to select the source equipment connected to the BD/DVD input.

11 Video 1
Press to select the source equipment connected to the Video 1 input.

12 Video 2
Press to select the source equipment connected to the Video 2 input.

13 Recorder 1
Press to select the source equipment connected to the Recorder 1 input.

14 Aux/TV
Press to select the source equipment connected to the Aux input.

With ARC enabled (see later section), press again to select Audio Return Channel from a suitable TV.

15 CD
Press to select the source equipment connected to the CD input.

16 Recorder 2
Press to select the source equipment connected to the Recorder 2 input.
17 Audio input type
Press this button to select between analogue, digital (optical/coaxial) or HDMI input types as the source of the audio for the currently selected source input.
The choices available depend on the inputs that have been assigned to that source, see later section.

18 Stereo modes
Press to listen to a source in either digitally processed stereo or stereo and sub modes.

19 Surround modes
Press to select Dolby Digital or DTS surround modes (with suitably encoded digital source material), or various Dolby Pro Logic II/IIX/IIZ, DTS Neo:6 modes for matrix encoded analogue or digital material.
Post-processing of digital surround types with Dolby Pro Logic IIX/IIZ or Neo:6 is also possible. See later decode mode tables for details.

20 Picture adjustment
Press to select various picture adjustments for sources that have the Scaler set to Process only (see ‘Source setup’ section in the manual). An adjustment bar will appear on the TV for the current item (Brightness, Contrast etc.) Press the Pic. Adj. button again to move to the next item.
Use the volume knob to adjust the level of the current parameter.
Note: For source material, the scaler cannot process (such as deep colour or 3D content). Pic. Adj. will have no effect.
This button is also used to change the scaler output resolution. Press and hold the button for 10 seconds and the current output resolution will appear on the 651R/751Rs front panel display. Keep holding the button down and the 651R/751R will change to the next available resolution and show it on the front panel display. See later section.

21 Zone 2
Press to choose Zone 2 and display its status. The next source change or volume adjustment will now affect Zone 2. See later section of this manual for more information.

22 Video 3/MP3
Press to select the source equipment connected to the Video 3 or MP3 input (if a device is plugged into its 3.5mm mini-jack input).
Note: The L audio input is also used for the supplied auto setup microphone. Refer to the ‘Auto setup’ section of this manual for more information.

For the 751R only
A HDMI 1.3 input is also available.

23 7.1 Direct
Press to select a 7.1 or 5.1 source (DVD-A or SACD player etc) connected to the 7.1 Direct In sockets.

24 Analogue stereo direct
Press to listen to the analogue inputs for the current source directly with no analogue to digital conversion or DSP processing for highest possible stereo sound quality.

25 Volume
Use to increase/decrease the level of the sound from the outputs of the 651R/751R.

26 Mute/Info
Press to mute the sound from the main and pre-amp outputs of the 651R/751R. Press again to cancel mute.
Note: Selecting a new source always cancels mute.
Press and hold to re-display the current decoding mode.
1. FM/AM antennas
All tuner antenna connections are made here. Refer to the ‘Antenna Connections’ section of this manual for more information.

2. RS232C
Used for control of the 651R/751R in Custom Install situations. A full protocol is available for the 651R/751R on our website.

3. USB interface (751R only)
A USB B type socket is fitted to the 751R to enable the playback of audio from a personal computer running either Microsoft Windows or Apple Mac OS X operating systems. Some distributions of Linux are also suitable.

Note: Always use a high quality USB connection cable certified as USB Hi-Speed. USB cable connections longer than 3m may result in inconsistent audio performance.

Always turn the Volume to minimum, or turn the 751R off before plugging/unplugging cables to the USB input or whilst booting up/shutting down your PC/Mac.

See later section for full details on USB audio.

4. Opto inputs/outputs
Toslink digital inputs for Video 1, Rec 1, BD/DVD and CD sources and also two Toslink digital outputs for Rec 1 and 2.

5. A/B HDMI outputs
Via the On Screen Display A, B or A and B outputs can be selected (for connection to two TVs or a TV and a projector for instance).

When both outputs are selected both show the same content.

HDMI A also supports an HDMI 1.4 Audio Return Channel from TVs that also support this feature.

This allows audio from the TVs own in built tuner to be received by the 651/751R. See later TV-ARC section for details.

6. HDMI
HDMI inputs compatible with the HDMI 1.4 standard. By Default the HDMI inputs are assigned to BD/DVD, Video 1 and Video 2, with the 4th input unassigned.

These inputs can be freely assigned, see later section on assigning video inputs.

All video inputs whether analogue or HDMI are transcoded and output via the HDMI outputs.

7. Video 1/2, Recorder 1/2, BD/DVD, CD and Aux
Please refer to the connection diagrams later in this manual for more information on these inputs and outputs.

8. Heat tunnel vent grille
Allows cooling of internal circuitry via the 651R/751R’s proprietary X-TRACT heat tunnel. DO NOT OBSTRUCT!
9. Expansion port
For connection to optional Expansion Source Modules as they become available. Contact your Cambridge Audio dealer for details.

10. Front IR switch
Turns the unit’s built-in IR receiver reception on/off if it is desired to use an IR repeater system plugged into the rear Main Zone IR Emitter Input instead.

11. Zone 2
Independant stereo audio and analogue video outputs to a second Zone (i.e. a room or area separate from the main area. The IR Emitter input allows control of the 651R/751R and its sources remotely from that Zone. See Zone 2 section in this manual for details.

12. Component video inputs
By default the component inputs are unassigned, these inputs can be freely assigned, see later section on assigning video inputs.

Note: The preferred connection method for video inputs is always Composite Video, then S-Video, then Component Video, then HDMI in ascending order of quality (HDMI being the highest quality). HDMI and Component Video sources often also support Progressive Scan which gives better picture quality if supported by both your BD/DVD player and TV.

13. Multi-Channel In
Connect to the output terminals of a DVD-A, SACD player or other 5.1/7.1 analogue source.

14. Multi-Channel preamp out
Connect to the 5.1/7.1 channel input terminals of another amplifier system, separate power amps, subwoofer or active loudspeakers. Two subwoofer outputs are supported with both receiving the same signal.

15. IR emitter out
Use with IR Emitters to control the sources from Zone 2 remotely. See later section.

16. Trigger out
12V triggers for controlling external amplifiers, curtains, motorised screens or other such equipment. See later section.

17. Main zone IR emitter in
Allows modulated IR commands from multi-room systems or IR repeater systems to be received by the 651R/751R.

18. Control bus
In - Allows un-modulated commands from multi-rooms systems or other components to be received by the unit. (Main Zone only)
Out - Loop out for control bus commands to another unit.

Note: The Emitter inputs are not looped out of the Control Bus output.

19. Power on/off
Switches the unit on and off.

20. Mains power lead
Once you have completed all connections, plug the AC power lead into an appropriate mains socket. The AV receiver is now ready for use.

21. Speaker terminals
Connect to loudspeakers with an impedance of between 4-8 ohms. 7.1, 5.1 or less connections can be made.

---

Zone 2 remote control

The Zone 2 remote only affects the Zone two outputs. It has no affect on the operation of the main zone.

- **Volume**: Use to increase/decrease the level of sound in Zone 2.
- **Standby**: Switches Zone 2 between Standby mode and On.
- **Skip**: Skips up or down the tuner presets that have been set.
- **Mute**: Mutes the audio output in Zone 2. Press again to cancel mute.
- **Sources**: Press the corresponding button to change the source for Zone 2. Pressing the Tuner AM/FM button a second time toggles between AM and FM modes.

Note: It is not possible to directly select TV/ARC or USB in Zone 2 as these are digital only sources.

- **Follow Main**: Sends an Analogue 2 Channel down-mix (L+C, R+C) of the source selected in the Main Zone to Zone 2.

This is useful if you want to listen to the same thing in both Zones (for a party perhaps) or wish to hear digital or surround sources in Zone 2 which cannot be directly selected by Zone 2.

Because the downmix is created from the main zones decoded output any source selected in the main zone including those connected by digital (opto/coax) and HDMI inputs can be sent to Zone 2 in this way.
## Main remote control

The 651R/751R is supplied with an Azur Navigator remote control. Insert the supplied AAA batteries to use. For full details of the various adjustment functions available from the remote, refer to the later sections of this manual.

This remote can be used in the Main Zone or Zone 2 (via an IR repeater system) and will automatically affect only the Zone in which it is used.

### Apple device compatibility

The Azur 651R/751R Navigator remote control can control the basic functions of Apple devices such as Apple TV and Apple’s iPod/iPhone/iPad range when docked in a Cambridge Audio or Apple dock.

Press and hold the source button that corresponds to the input that the Apple product is connected to whilst also pressing one of the buttons below.

The functions are slightly different depending on the Apple product.

- **Enter**
- **Menu**
- **Play/Pause**
- **Used to control volume and/or navigate menus.**
- **Used to navigate menus or Skip/Scan depending on Apple product used.**

In addition, the Azur remote can be paired with up to six specific Apple devices using any of the six source buttons. This can be useful if you have more than one Apple product.

**For more information on pairing refer to your Apple device’s instruction manual.**

- **Pairing** – To pair with an Apple device, press and hold the required source button along with the **MODE** button for six seconds. Some devices like Apple TV have visual indication once pairing is achieved.
- **Un-pairing** – To un-pair an Apple device, press and hold any of the source buttons along with the **STEREO MONO** button for six seconds.
Front panel display

1. Output channel indicators
   Shows the currently active channels depending on decoding mode and source material. Icons lit indicate channels being output by the 651R/751R.

   Z2
   Indicates Zone 2 is active (on).

   Room EQ
   Indicates Audyssey 2EQ® is enabled.

2. Decoding mode indicators (PCM, Dolby Digital, DTS etc)
   Shows the current decoding mode, Dolby Digital, DTS etc. In conjunction with the Output Channel indicators these give full details of the current processing mode.

Direct indicator
Lights when the 651R/751R is in a Direct mode - Analogue Stereo Direct or 7.1 Direct.

3. Main information display
   Shows the current source selected, also the surround mode and station name/frequency when in tuner mode etc.

4. Mode icons
   HDMI
   Indicates the current source audio input type is HDMI.

   Digital/Analogue indicators
   Indicates whether the current source audio input type is Digital (S/P DIF/Toslink) or Analogue.

Display examples

- **BD/DVD**
  Indicates a 5.1 Dolby Digital source being played back as 5.0 (Sub off).

- **BD/DVD**
  Indicates a 7.1 playback of DTS-HD Master material.

- **BD/DVD**
  Indicates a 2.1 output created in the digital domain from analogue input material.

Loudspeaker connections

To avoid damaging the speakers with a sudden high-level signal, be sure to switch the power off before connecting the speakers. Check the impedance of your speakers. Speakers with an impedance of between 4 and 8 ohms (each) are recommended.

The coloured speaker terminals are positive (+) and the black speaker terminals are negative (-). Make sure correct polarity is maintained at each speaker connector or the sound can become weak and “phasey” with little bass.

Prepare the speaker cords for connection by stripping off approximately 10mm (3/8”) or less (no more than 10mm, as this could cause a short-circuit) of the outer insulation. Twist the wire tightly together so there are no loose ends. Unscrew the speaker terminal knob, insert the speaker cable, tighten the knob and secure the cable.

Note: All connections are made via loudspeaker cable, except if using an active subwoofer which would be connected via a standard RCA phono cable.

Banana Plugs (4mm standard) connected to the speaker cable are recommended for direct insertion into the speaker terminals.

Please refer to the ‘Speaker Configuration’ section of this manual for more information on 5.1 and 7.1 speaker setups.
Analogue audio connections

Note: Do not plug in the mains power lead or turn the unit on until all connections have been made.

Connect to source equipment using stereo phono cables (stereo 2RCA-2RCA). Tape/MD/CDR recorder/players require two sets of stereo phono/RCA cables, one for recording, one for listening.

Digital audio connections

Two types of digital audio connections can be made to the 651R/751R:
1. Optical (Toslink)
2. Coaxial (S/P DIF)

Either type can be used for a source as the 651R/751R automatically uses the active one.

Note: Only one connection type should be used per source.

A recording device such as MD or CD-R can be connected to the digital outputs as shown.
HDMI input connections

HDMI (High-Definition Multi-Media Interface) is an all digital connection that can carry both audio and video in one cable. Direct digital transfer of audio and video and support for various types of High Definition video content and high resolution audio make this the best connection type to use. The HDMI inputs can be assigned to the BD/DVD, Video 1, Video 2, Recorder 1, Aux, CD, Recorder 2, Expansion or 7.1 Direct sources (see the “Assigning HDMI sources” section for more information).

Analogue video input connections

Three types of analogue video connections can be made to the 651R/751R: 
1. Composite - connect with single 75 ohm Video phono cable (RCA-RCA). 
2. S-Video - connect with S-Video cable. 
3. Component - connect with 75 ohm Component video cables (3RCA-3RCA) 

For sources that support HDMI this is always the best choice.

For sources that only support analogue video for best picture quality we recommend making Component video connections, then in declining order of quality, S-Video connections and then Composite video connections.

The 651R/751R is able to transcode i.e. upconvert analogue video to HDMI for the main monitor/TV output.
Video output connection (HDMI A & B)

Connection to the TV is by HDMI. The 651R/751R converts incoming analogue video to HDMI and scales it for best picture quality. See later section.

Two outputs are fitted that can be used individually or at the same time (for a TV and projector perhaps).

**Note:** Both outputs always show the same video.

See the HDMI/Component Assign menu below on how to select the active HDMI output in the On Screen Display menus.

HDMI A also supports an HDMI 1.4 Audio Return Channel from TVs that also support this feature.

This allows audio from the TVs own built tuner to be received by the 651R/751R. See later TV-ARC section for details.

**5.1/7.1 direct in**

DVD-A or SACD players can be connected to the 651R/751R via its 5.1/7.1 Direct inputs allowing multi-channel music playback from these sources.

DVD-A and SACD both support 5.1 output. The 651R/751R’s direct inputs also allow optional connection of Surround Back or Surround Left and Surround Right signals for compatibility with future 7.1 sources or external decoders.

To select the Direct Input press the 7.1 Direct button on the front panel or remote.

If the player is selected via the BD/DVD button you can then view its content and decode any relevant surround sound soundtracks.

If 7.1 Direct is then pressed, the audio is now switched to come from the players analogue outputs.

You can also assign the same HDMI input to 7.1 Direct so that the picture is not lost.

These connections are pure analogue for best sound quality and no DSP processing or Bass and Treble adjustment by the 651R/751R is possible.

A Digital or HDMI input can be made to the 651R/751R for surround sound decoding and an analogue 5.1 connection to 7.1 Direct for DVD-A/SACD playback.
If it is desired to connect external power amplifiers, use Phono/RCA leads connected to the 7.1 Preamp Outputs on the rear panel. For 5.1/7.1 use set the 'Multi Ch.Out' setting in the 'Advanced Audio Setup' OSD menu to 'Pre Out' rather than 'Normal'. This mutes all the internal power amplifiers as they are not being used.

Alternatively the 651R/751R features an External 2-Channel mode. This allows the 651R/751R to reproduce all the surround channels of suitable source material (Centre, Surrounds and Sub) whilst the Left and Right Front speakers are driven by an external power amplifier or other amplifier capable of supporting fixed level inputs (e.g. Cambridge Audio’s own 8 series amplifiers).

When pressing Video 3/MP3, the 651R/751R automatically selects the MP3 socket if there is a device plugged into it.

**Aerial connections**

**FM aerial**

Connect an aerial to the FM 75 ohm socket (a simple wire aerial is supplied only for temporary use). Extend the lead and move the aerial around until you get the best reception. For continued use, we strongly recommended using a 75ohm outdoor FM aerial.

**AM loop aerial**

Connect each end of the single length antenna to the antenna terminals. Place the antenna as far from the main system as possible to prevent unwanted noise and to obtain optimum reception. If the AM loop aerial provided does not receive sufficient reception, it may be necessary to use an outdoor AM aerial.
651R/751R setup

The full setup of the 651R/751R is a reasonably simple 3 stage process. The Speaker Setup stage can either be performed manually or via the Audyssey Auto Setup procedure.

Stage 1: Speaker setup (Speaker delay, Crossovers and Level calibration, via Audyssey or manually)
Stage 2: Assigning HDMI and Analogue video inputs
Stage 3: Source setup

Speaker setup

To perform a manual speaker setup you always need to first tell the unit what kind of speaker system you have connected.

If you prefer to use the Audyssey Autosetup process then you don’t need to tell the unit what kind of speaker system you have if it is a simple 5.1 or 7.1 system, Audyssey will work this out for itself.

However if you wish to use 5.1 + Height mode or 5.1 with the rear SBL/SBR reassigned to biamping the fronts or 5.1 with the SBL/SBR outputs driving Zone 2 speakers, then you must tell the unit this before performing any Audyssey Autosetup.

In any case setting the speaker configuration before running Audyssey will not do any harm.

The options are 5.1, 7.1 or 5.1+H as shown below. The 651R/751R can support up to a 7.2 speaker setups which means 7 speakers (Front Left, Front Right, Centre, Surround Left, Surround Right, Surround Back Left, Back Right) plus two mains powered subwoofers (the .2).

Refer to the diagrams below for typical examples of loudspeaker setups. Always adjust the speaker and listening positions until you are happy with the sound. Please refer to your loudspeaker and subwoofer manuals for more detailed positioning information.

Background information

1) Front Left and Right speakers
For stereo and multi-channel sound.

2) Centre speaker
For dialogue and centre sounds. Ideally position at a similar height to the front left and right speakers (above or below the TV/monitor). Using a centre speaker from the same manufacturer/range as used for the front left and right speakers is advisable. This “timbre matching” allows surround effects to flow more naturally from left to right without obvious transitions between the speakers.

3) Surround Left and Right speakers
For ambient and multi-channel sound. Floorstanding speakers should be angled towards the listening position. Bookshelf/standmount speakers should be wall mounted or used with dedicated speaker stands, positioned at or above ear height.

4) Subwoofer
For improving the bass in your system, as well as reproducing dedicated LFE (Low Frequency Effects) cinema effects when playing Dolby Digital or DTS encoded discs. Your subwoofer can often be placed almost anywhere in the room as bass is less directional, but experimentation with positioning is recommended.

5) Surround Back Left and Right speakers
Individual back speakers in place of a single surround back. Used with the 7.1 processing types. Remember to experiment with the positions until you are happy with the sound.

6) Front Left and Right Height speakers
Height speakers placed above the Front Left and Right to give the sound field a vertical component with suitably encoded material or when using Dolby Pro Logic IIZ post processing.

In all cases the 5.1, 5.1+H or 7.1 in fact relate to the maximum number of speakers that can be used, as the Centre, Sub and Surround speakers can all be deleted if required (although of course performance is reduced). For example, if you choose not to use a Centre Channel speaker you can set this to ‘None’ in the settings as shown later and the 651R/751R will automatically redirect the centre channel audio information into the Left and Right Front Channels, creating what is known as a ‘Phantom Centre’.

Similarly, you might decide not to use a subwoofer if your main Left and Right speakers are capable of reproducing enough bass for a satisfying music/movie experience. The 651R/751R will then automatically re-direct the bass from the Subwoofer/Low Frequency Effect channel to the Left and Right Front Speakers.

Performing the setup

Note: This setup is important as the 651R/751R will also automatically use this information to select appropriate Dolby and DTS decoding modes dependant not only on the source material but also the speaker package it knows you have.

To tell the unit the type of package you have, turn on the On-Screen Display via the remote button as shown. Highlight the ‘Speaker Setup’ menu by using volume up and down on the remote then go to it by pressing Enter:

Set the Decode mode as 5.1, 7.1 or 5.1+H by highlighting the Decode Mode item and using the Left and Right arrows to scroll through the options:
Manually setting speaker size

Select the Speaker Config menu.

<table>
<thead>
<tr>
<th>Speaker Config Menu</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Decode Mode</td>
<td>T.1</td>
</tr>
<tr>
<td>Front L/R</td>
<td>Large</td>
</tr>
<tr>
<td>Surr. L/R</td>
<td>Large</td>
</tr>
<tr>
<td>Surr. Lb/Rb</td>
<td>Large</td>
</tr>
<tr>
<td>Subwoofer</td>
<td>Yes</td>
</tr>
<tr>
<td>FL R must be Large when Sub is off</td>
<td></td>
</tr>
</tbody>
</table>

Now move down and by highlighting each speaker in turn and using the Left and Right arrows select from ‘Large’, ‘Small’ or ‘None’ for each speaker. ‘Large’ or ‘Small’ are used to describe each speaker in terms of bass response, they do not necessarily reflect the actual physical size of the speaker.

- **Large** = Speakers with an extended low frequency response of approximately 20-40Hz to 18-20kHz (floorstanders or high quality larger stand-mounted speakers).
- **Small** = Speakers with a less extended low frequency response of approximately 80-100Hz to 16-20kHz (small stand-mounted, bookshelf or satellite speakers).

Setting each speaker allows the 651R/751R to perform what is called Bass Management and to direct low frequency bass from music and the Low Frequency Effects channel of surround sound material to those speakers best able to reproduce it. If you do not wish to use any of the speakers set its setting to ‘None’.

The Subwoofer output can also be set to Yes or No. If no sub is being used make sure this setting is set to No to allow the 651R/751R to re-direct the bass information in this channel to other speakers.

Note: The 651R/751R will force some speakers to certain settings in the following circumstances:

- **The Front Left and Right speakers may be ‘Large’ or ‘Small’ but never ‘None’ as they are always required for any type of music/movie reproduction.**

  Bass must always be reproduced by either the Front Left and Right or Subwoofer channel (or both). Setting the Front Left and Right to ‘Small’ will result in the Subwoofer automatically being set to ‘Yes’. Setting the Subwoofer to ‘No’ will automatically result in the Front Left and Right being set to ‘Large’.

  If the Front Left and Right cannot reproduce low frequency bass a Subwoofer must be used. I.e. If the Front Left and Right are set as ‘Small’ the Sub must be Set to ‘Yes’.

  Also, setting the Front Left and Right as ‘Small’ will always set the other speakers as ‘Small’ (and the Sub to ‘Yes’). This is because LFE/bass information should not be redirected to the surround channels.

  To store the setting simply come back out of the OSD (pressing the OSD button always moves back one menu item, and then exits and stores from the main menu screen).

Manually setting speaker delay

Because the speakers in a surround sound system are usually different distances from the listener the 651R/751R incorporates the ability to apply a variable digital delay to each of the channels so that the sound from each arrives at the same time at the listening position for best surround-sound effect.

To set the delay times automatically, refer to the Audyssey auto setup section of this manual.

To set the delay times manually, simply measure the distances from the listening position to each speaker as shown in the following diagram:

Set the distances in the OSD Speaker Distance menu to the nearest value in metres (1 foot = 0.3 metres). The speed of sound is approx 340 metres per second, the 651R/751R thus introduces approx 3mS of delay per metre of distance set.

Go to the ‘Speaker Distance’ and highlight each speaker in turn. Set the distance to the nearest value to that which you measured by using the Left and Right arrows (the values do not need to be exact).

Press the OSD button to exit the menu.
Manually setting level calibration

The 651R/751R allows level calibration to match the acoustic level between different types/sizes or even manufacturers of speaker that may be being used for each channel. This is achieved by adjusting the relative level of each speaker. This can be done manually through the ‘Level Calibration’ menu in the OSD or automatically, see the following Audyssey auto setup section of this manual.

The basic process for manual adjustment is to listen to or measure with a Sound Pressure Level (SPL) meter (more accurate and recommended but not essential) the level of sound produced by each speaker and set relative levels for each speaker so that they all sound the same loudness at the normal listening position. The 651R/751R incorporates a Test Signal Generator (broad-band white noise) to facilitate this.

Press the OSD button on the remote control then select the ‘Level Calibration’ menu. Now turn on the test signal by highlighting this item and pressing the Left or Right arrows:

You can now move up and down the channels using Volume Up/Down on the remote. Each time a new channel is selected the test signal will be heard to move to that channel. Compare the loudness of all channels as heard at the listening position.

A “rushing” or “hissy” sound should be heard. Now adjust the channels so they all sound the same (in terms of loudness only). Channels of different frequency responses can sound different in terms of the “tone” of the sound i.e. more or less hissy).

Pick the channel that sounds most different and select it to listen to the test signal. Now adjust the relative level in dB (using Arrow left/right on the remote) and continue comparing it to other channels until it is of equal loudness. The level can be adjusted up to + or -10dB in 1dB steps. Repeat the process with the next most different channel. Once all channels sound the same in terms of loudness, press the OSD button again to save the settings and exit the menu.

Manually setting sub crossovers and bass management

The 651R/751R performs bass management for any speaker that is set to ‘Small’ in the OSD. This means that bass for speakers that are unable to reproduce bass effectively is instead routed to the subwoofer. This is important as the 651R/751R needs this information in order to test and determine the point at which this transition is made. In other words they set the frequency below which bass is routed from any ‘Small’ speakers and into the subwoofer channel. It should be understood that bass sent to the subwoofer by bass management is different to bass encoded into the surround-sound material as a dedicated Low Frequency Effects channel.

If the source material contains a separate LFE channel (i.e. DD or DTS material) this is always routed to the subwoofer if (if it is On) and is not affected by the crossover setting. Some encoding types (Such as Dolby Pro Logic II/Ix and Neo:6) do not actually have a LFE channel.

The default setting for all bass management crossovers is 80Hz and is a good global starting point. If you do not wish to make any adjustments simply leave all crossovers at this default setting.

Note: These settings are actually only used for speakers that have been set to Small in the Speaker Configuration Menu.

For advanced users it is however possible to adjust the speaker crossovers used for any speakers set as ‘Small’ independently to allow for the fact that you may wish to direct bass away from front floorstanding speakers (and to the Subwoofer) at perhaps 50Hz but away from Surround Left and Rights at perhaps 100Hz. If you wish to make these adjustments it is best to consult your loudspeaker manufacturer’s documentation or contact your dealer to determine the frequency response of your system and where each speaker types bass response starts to tail off (often called the 3dB or 6dB roll off/cutoff point). This would be approximately the point the corresponding crossover should be set to.

Alternatively, the Audyssey Autosetup procedure can measure and set appropriate crossover points for your speakers.

Audyssey 2EQ® and Autosetup

Using the supplied calibrated microphone, the Audyssey 2EQ system can perform ‘Autosetup’ by automatically determining the number of speakers you have connected, their ‘size’ and crossover frequencies (for the purpose of bass management) and their distances from the listening position.

Further to this Audyssey 2EQ can also remove deficiencies in playback caused by sub optimal room acoustics.

It does this by capturing any acoustical problems at the listening area in both the frequency and time domain and applying sophisticated corrective equalisation.

The result being improved sound quality, clarity of dialogue, and a well-balanced sound for more than one listening position.

Audyssey 2EQ can also be used with Audyssey Dynamic EQ® and Audyssey Dynamic Volume® as described fully later in this section.

On the 651R/751R Audyssey 2EQ offers two ways of measuring: The simpler Audyssey Autosetup method and Audyssey Autosetup + 2EQ.

Audyssey Autosetup uses the measurement from one position to perform the speaker settings only.

Audyssey Autosetup + 2EQ uses the measurement from 3 positions to correct room response in addition to the speaker settings.

Before using either function, make sure to connect and correctly position all of your speakers.

If rather than a standard 5.1 or 7.1 setup you are bi-amping your front speakers or using the SBL/SBR speakers for Zone 2 or wish to run a 5.1+ Height configuration be sure to make these settings first before then running Autosetup.

This is important as the 651R/751R needs this information in order to test the speakers correctly during the Autosetup process.

Performing Autosetup

The simplest Audyssey based auto setup system is a two stage process, firstly it checks how many speakers you have connected and reports whether they appear out of phase or not. This allows you to trap any errors in connection.

If all is well you can then progress to the second stage which makes further measurements of each speaker in turn to automatically set the distance (delay time), calibrated level and crossover point for each one.
Audyssey 2EQ Room EQ

This is a more sophisticated version with a longer second stage that measures the frequency response of all of your speakers three times at three different points in the room and then calibrates and equalizes them to optimise the sound for your actual listening environment (Room EQ). To perform Audyssey Autosetup with no Room EQ simply select Audyssey Autosetup from the menu. To perform Autosetup and Room EQ select Audyssey Autosetup & 2EQ.

The process for both system is the same other than the extra sets of measurements so we’ll describe the Audyssey & 2EQ case only below.

First, connect the supplied microphone to the front Left front panel audio input on the front panel via the supplied adaptor and place it at your normal listening position in the room.

Press the OSD button on the remote control to access the OSD and then select the Speaker Setup Menu. Now select the Audyssey option you want.

Follow the on-screen instructions and press ‘Enter’ on the remote control when ready to start the Audyssey Autosetup function.

Once activated the OSD will display the message below and the word 'Audyssey Auto Calibration' will also be displayed on the front panel of the 651R/751R to confirm.

A series of test signals will now be output from all of the connected speaker terminals of the 651R/751R (including the Subwoofer output).

If any speakers appear unconnected or out of phase carefully check the connections on the speaker and the back of the unit. Also check any bi-wiring links that might be present on the speaker. For any out of phase speakers check that the relevant + terminal of the 651R/751R goes to the + terminal of that speaker and similarly the – terminal of the 651R/751R goes to the – terminal of the speaker for that channel.

Note: Like all such systems there are some limitations. Speakers that exhibit very strong phase angles or deliberately wire some drive units out of phase can of course appear to the system as an out of phase speaker when correctly connected. If a speaker is reported as out of phase but is correctly wired it is ok to proceed to the next step.

If necessary press the I/O button to cancel and perform a retest or press Enter to start the second part of the autosetup procedure as below.

Again a series of test signals will now be output from all of the connected speaker terminals and Subwoofer. The 651R/751R uses these to measure the levels crossovers and distances (and hence introduce the correct delays) appropriate to your speakers and room characteristics.

For Audyssey & 2EQ the unit will ask you to make a second measurement after having moved the microphone to the left boundary of the normal listening area occupied by yourself and other listeners (for instance the left hand end of your sofa). Then a further measurement after having moved the microphone to the right boundary of the normal listening area. In both cases the microphone should be approximately at your normal listening height.

Once finished the unit will display a screen similar to the one below reporting which speakers were found and any that appear out of phase.
When the auto setup of the 651R/751R is completed successfully, the 651R/751R displays a 'Measurement Complete' screen and then shows the Advanced Audyssey Setup screen as per following section.

If you have just performed Audyssey Autosetup & 2EQ you will see 2EQ is enabled plus you can now enable Audyssey Dynamic EQ and/or Dynamic Volume as well (if desired).

If you have just performed a simple Audyssey Autosetup you will see 2EQ is disabled (and cannot be enabled) but you can still enable Audyssey Dynamic EQ and/or Dynamic Volume (if desired). See next section for full details.

To simply accept the settings by pressing the (I/O) button to exit the menu.

To accept the settings, simply press the (I/O) button and press again to exit the menu.

The Speaker Distance crossover and Level Calibration settings for each speaker will have been updated.

It is of course now possible to go into the Speaker Delay and Level Calibration menus if you want to manually check/adjust the settings made by the system, and it is always advisable to check them as no system can be totally foolproof.

To exit the auto setup menu of the 651R/751R continue to press the OSD button on the remote control to exit all menus or until 'OSD is no longer displayed on the front panel. You can now unplug the microphone and put it away for future use.

Notes:

– Some speakers such as bi-polars that radiate in more than one direction can make it difficult for Autosetup to accurately measure their level and distance from the listening position.
– Active subwoofers with DSP have a small delay time built into their electronics. Because the 651R/751R measures the total delay time including any in-built delay it will still apply the correct amount of delay that when added to the inbuilt delay gives the correct response. However the distance reported in this case will be a little more than the physical measurement.
– If a subwoofer is present the Autosetup treats most speakers as ‘Small’ and sets a low crossover point (unless they genuinely have a bass response lower than 40Hz).

This does not mean they are physically small it just means that the system will automatically send the very low bass (only) from these channels to the subwoofer for the best system response.

In all cases it is always advisable to manually check the settings autosetup has made for a ‘reality check’ to ensure there are no obvious errors.

Advanced Audyssey

Further to Room EQ which can only be enabled if an Audyssey & 2EQ procedure has been completed, it is possible to enable two extra Audyssey features (which are by default disabled).

Audyssey Dynamic EQ®

Music, movies and games are typically mixed at fairly high volumes but played back at more modest levels in a domestic setting.

Because the response of the human ear varies with level, the perceived frequency response and surround field in a domestic environment can at various levels be altered from that actually intended.

Audyssey Dynamic EQ® attempts to solve this problem by taking into account human perception, room acoustics and information from both incoming source levels and actual output sound levels in the room.

Audyssey Dynamic EQ works in tandem with Audyssey 2EQ to vary the EQ applied to the speakers in sympathy with the acoustic level to achieve a tonal balance and surround impression that remain constant despite changes in volume.

When Audyssey Dynamic EQ is turned on an option for Dynamic EQ offset appears.

Movies are mixed in rooms calibrated for a standard film reference.

Audyssey Dynamic EQ is referenced to this standard film level and makes adjustments to maintain the reference response and surround envelopment relative to it.

However, the film reference level is not always used in music or other non-film content.

To allow for this the Dynamic EQ Offset provides four settings that can be selected, three for when the mix level of the content is not film standard.

0 dB (Film Ref): This is the default setting and should be used when listening to movies.
15 dB: For pop/rock music or other program material that is mixed at very high listening levels or with a compressed dynamic range.
10 dB: For jazz or other music that has a wide dynamic range. This setting should also be selected for TV content as that is usually mixed at 10 dB below film reference.
5 dB: For content that has a very wide dynamic range, such as classical music.

Audyssey Dynamic Volume®

Audyssey Dynamic Volume® attempts to solve the problem of large variations in volume level between television programs, commercials, and between the soft and loud passages of movies.

Dynamic Volume looks at the current volume setting and then monitors the program material in real time, whenever necessary, Dynamic Volume makes the necessary rapid or gradual adjustments to level maintain the desired playback volume level.

The idea is that perceived bass response, tonal balance, surround impression, and dialog clarity remain the same whether watching movies, flipping between television channels, or changing from stereo to surround sound content.

Audyssey Dynamic EQ is integrated into Dynamic Volume so turning on Dynamic Volume also turns on Dynamic EQ.

Dynamic Volume has three settings (and Off)

Heavy: This has the narrowest dynamic range. If you want to watch an action movie late at night and not wake up your family use Heavy.

Medium: This is the most common setting for daily television use in a living room setting and works well to tame the volume increases of advertisements.

Light: This setting offers a wider dynamic range and can be used when watching an action film where you want a full dynamic experience but want to maintain volume levels appropriate for family viewing.

Off: The full dynamic range is left untouched.
Assigning video inputs

The 651R has 4 HDMI (High Definition Multi-Media Interface) inputs and two HDMI outputs. The 751R has 6 HDMI inputs (one of which is on the front) and two outputs. HDMI is a fully digital audio/video system for picture and audio in digital format for best possible picture quality.

HDMI outputs on Blu-ray, DVD players and Set-top boxes also often support higher resolution formats including progressive scan types. Consult both your HDMI source and TV manuals for details, it is often possible to select from various options, you will want to select the highest quality output that both your source and TV are compatible with.

From Blu-ray players, HDMI can also carry the latest Dolby Digital Plus and True-HD formats as well as DTS-HD High Resolution and Master Audio. Ensure that the HDMI output of your player has been set to ‘Bitstream’ or ‘Raw’ to pass the formats to the 651R/751R for decoding. Also some Blu-ray players feature settings to allow down conversion of Dolby Digital Plus etc. to backwards compatible Dolby Digital 5.1 for older AV receivers which do not support these formats.

Ensure any such settings are disabled to allow our 651R/751R access to all the latest formats. For all the above reasons HDMI is the preferred connection method for both Audio and Video.

The 651R/751R can however also accept Composite, S-Video and Component video for sources without HDMI outputs and automatically transcode and scale this video to the HDMI output. Each of the HDMI and Component inputs are freely assignable in the OSD to any source. The Composite and S-Video inputs are physically fixed.

The default setup is as below.

Highlight each HDMI and Component input in turn if you wish to assign it to a different source (with the Left and Right arrows).

Highlight each HDMI and Component input in turn if you wish to assign it to a different source (with the Left and Right arrows).

The 651R/751R automatically transcodes any analogue video sources selected to HDMI using the Scaler settings as described later.

Note: The first four sources are Assigned both an HDMI and a Component input.

This may seem strange but this just means that these sources have not only their own HDMI connections but their own Component connections and the physically assigned S-Video and Composite Video connections all available to them.

This is useful because Zone 2 uses the analogue video inputs only. Thus if you are using Zone 2 you will probably want a source to be assigned an HDMI for viewing in the main room and plus perhaps a component video connection for viewing in Zone 2. What video input you select to view when you select each source in the main room is determined by the Video Input Select menu explained next.

Navigate to the Video Input Select menu.

For each source the currently selected video input type will be shown. This menu allows you to choose which of the possible video connections that each source has you actually wish to use.

i.e. if your games console has only an S-Video output and is connected to the VIDEO1 source, you would select VIDEO1 and then change it from HDMI 2 to S-Video.

For the main room the 651R/751R automatically transcodes any analogue video sources selected to HDMI using the Scaler settings as described later.

Note: Assigning a HDMI input to a source automatically also selects Scaler Bypassing for that source.

You can process these sources if you wish simply by setting the Scaler to Process in the Scaler Assign/processing menu afterwards.

Source setup

The next step is to select each source input in turn on the 651R/751R and tell the unit:

- The type of audio connection you want to use for that source (Analogue, Digital or HDMI).
- The processing mode for that source.

The 651R/751R remembers these settings individually for every source input and automatically recalls them as and when you change source input.

Audio connection type

Select the ‘Audio Input Select’ menu. Highlight each source in turn and select either analogue, digital or HDMI input types (use the Left and Right arrows):

Audio Input Select

<table>
<thead>
<tr>
<th>Source</th>
<th>HDMI</th>
<th>Analog</th>
<th>Digital</th>
<th>HDMI</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIDEO 1</td>
<td>HDMI 1</td>
<td>N/A</td>
<td>N/A</td>

<tr>
<td>Aux</td>
<td>Analogue</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

The options shown will be Analogue, Digital and HDMI if that source has been assigned an HDMI input for video as above.

Analogue inputs will require a stereo phono/RCA to phono/RCA cable connection to the 651R/751R. Digital inputs will require either a 75ohm digital type phono/RCA to phono/RCA co-axial cable (S/P DIF) or an optical fibre cable (TOSLINK). The 651R/751R will automatically use whichever is connected. Do not make connections to both the Optical and Co-axial inputs for a source.

Once you have set the audio types exit the OSD to save.

This setting can also be changed at any time without using the OSD by pressing the Audio Input Type button on the front panel or remote, this will then cycle between analogue, digital or HDMI input types where available for the currently selected source, as usual they will then be remembered the next time you return to that source.

Scaler assign/processing

The 651R/751R features an Anchor Bay ABT2010 digital video processor/scaler.

This can if desired process any of the video sources and scale them up (or down) to various resolutions.

This feature is most useful with analogue video sources where the processor can clean up the picture and scale it to 720p, 1080i or 1080p before outputting them over HDMI to a suitable TV.

On entering this menu you will see that the sources that you assigned an analogue video input are automatically set to Bypass (i.e. no processing).

</tbody>
</table>

This is because many HDMI sources will be natively 1080p or may have high quality processing built in where it is best to send this video directly to the TV without any further processing in the 651R/751R.
For analogue video sources it is almost always desirable to process these for best picture quality before passing them to the TV.

To change the Process/Bypass status of any source (including HDMI) simple select it in the menu and use the left and right buttons on the remote.

You can also set the desired output resolution for any Processed video (Bypassed video is unaffected).

The options are 480p 60Hz, 576p 50Hz, 720p 50Hz, 720p 60Hz, 1080i 50Hz, 1080i 60Hz, 1080p 50Hz and 1080p 60Hz.

Note: 3D TV content, 24fps content or other video standards that the 651R/751R cannot process or recognise are always Bypassed to the output whatever the setting in this OSD.

Video processing settings

This menu selects the settings that will be applied to any sources that have had the Scaler set to Process in the Scaler Assign Menu, any sources set to Bypass as unaffected.

The options are:

- **Resolution**: Sets the output resolution, the options are 480p, 576p, 720p, 1080i and 1080p. I means interlaced and P means progressive scan.

- **Frame Rate**: Sets the output to be fixed at 60Hz (NTSC format) or 50Hz (PAL/SECAM formats).

- **Colour Space**: Sets the output colour space format, this is the format used to describe the colour of each pixel in an image, the options are RGB, YCbCr4:2:2, YCbCr4:4:4 and Auto.

- **Aspect Ratio**: Sets the output frame rate to the incoming frame rate. If your TV can handle both PAL and NTSC signals the best option is AUTO (as this requires the least scaler processing). If your TV only supports one or other format fix the output to that it supports.

- **Colourimetry**: The incoming video of 24fps is always automatically bypassed by the scaler and output in its native format (no change to resolution, frame rate or any other settings). The colourimetry of the output the 651R/751R can provide, depends both on the source equipment (Such as a DVD player) to the 651R/751R.

**Surround sound modes**

The 651R/751R supports several music and home-cinema listening modes.

Note: Dolby True HD is only ever transmitted over HDMI.

**DOLBY DIGITAL**

A new lossless audio CODEC from DTS, rather than being incompatible with earlier versions, DTS-HD Master Audio is transmitted as an extension to a normal DTS bitstream. A second embedded stream is sent which contains the “difference” between the original studio master and the lossy compressed DTS plus the two extra channels. DTS-HD Master Audio enabled devices (such as the 651R/751R) are able to use this difference information to recreate a bit for bit lossless version of the original 5.1 data. Devices which do not support the Master Audio extension simply decode the original 5.1 DTS stream and ignore the Master Audio extension providing backwards compatibility.

**DTS-HD High Resolution Audio**

Known also as DTS-HR an extension to the original DTS audio format. DTS-HD High Resolution Audio supports 7.1 fully discrete channels compared to DTS’s 5.1 (or 6.1 in its ES variant where the 6th channel is matrix encoded). These DTS-HD Plus streams are not backward compatible with legacy Dolby Digital decoders but require an AV Receiver developed to decode them (such as the 651R/751R) and an HDMI connection as DTS-HD Plus is currently only transmitted over HDMI. It is however a requirement that any Dolby Digital Plus enabled Blu-ray player must also be able to transform the Dolby Digital Plus into a backwards compatible DTS Digital Plus 5.1 output for playback on legacy Dolby Digital systems. The 651R/751R is however fully compatible with Dolby Digital Plus.

**DTS-HD High Resolution Audio**

Known also as DTS-HD an extension to the original DTS audio format. DTS-HD High Resolution Audio supports 7.1 fully discrete channels compared to DTS’s 5.1 (or 6.1 in its DTS ES Matrix or DTS ES Discrete variants). As with DTS-HD Master Audio a second embedded stream is sent which contains the “difference” between the original studio master and the lossy compressed DTS plus the two extra channels, however in this case the extra stream is also formed by lossy compression. Effectively this is a 7.1 version of DTS which can be decoded by devices (such as the 651R/751R) which are able to decode DTS-HD High Resolution Audio. Devices which do not support the High Resolution extension simply decode the original 5.1 DTS stream and ignore the High Resolution extension providing backwards compatibility.
DOLBY

**PRO LOGIC II**

The replacement for the original Dolby Pro Logic, Dolby Pro Logic II is a technology where 5 channels (Front Left, Front Right, Centre, Surround Left, Surround Right) are encoded into a Stereo mix by an analogue process. Dolby Pro Logic II material can be played back by normal Stereo equipment (as Stereo) or decoded into 5 channel surround-sound.

Dolby Pro Logic II is compatible with the earlier 4 channel (Left, Centre, Right and mono Surround) Dolby Pro Logic system (which was the decoding counterpart to Dolby Surround encoding) as used widely on Video tapes, TV broadcasts and earlier films.

**Note:** Dolby Pro Logic does not include a Low Frequency Effects channel for the Subwoofer, but the 651R/751R can create a Subwoofer output (for 5.1) via Bass management. Refer to the ‘Operating instructions’ part of this manual.  

DOLBY

**PRO LOGIC IIX**

A newer version of Dolby Pro Logic II which is able to recreate 7 discrete surround sound channels from standard encode Stereo source material. Dolby Pro Logic IIX also has modes for post processing either Stereo material or 5.1 material into 7 channels whether or not it has been Dolby Pro Logic IIX encoded. When 5.1 decoding is required, Dolby Pro Logic II decoding will always be used by the 651R/751R in place of Dolby Pro Logic IIX as its only output for 7 channel output.

**Note:** Dolby Pro Logic IIX does not include a Low Frequency Effects channel for the Subwoofer, but the 651R/751R can create a Subwoofer output (for 7.1) via Bass management. Refer to the ‘Operating instructions’ part of this manual.

DOLBY

**PRO LOGIC IIX+**

A new Dolby matrix technology that delivers additional height channels positioned above the front left and right speakers. Dolby Pro Logic IIX+ identifies spatial cues that occur naturally in most content plus ambient sound and amorphous effects such as rain or wind and directs them to additional front height speakers. Movie and game producers can also mix specific additional height channels into a 2ch, 5.1 or 7.1 soundtrack, which Dolby Pro Logic IIX+ will then decode as a post process.

If it is desired to use Dolby Pro Logic IIX+, you should set the 651R/751R to 5.1 + Height mode, connect two speakers to the SBL and SBR outputs and physically position them above your left and right front speakers, then select Dolby Pro Logic IIX+ post processing. See later section.

A DTS technology which is able to recreate 6 channel (Left Front, Right Front, Centre, Left Surround, Right Surround, Surround Back) surround sound from suitable analogue matrix encoded stereo source material. DTS Neo:6 material can be played back by normal Stereo equipment (as Stereo) or decoded into 7.1 by sending the Surround Back decode to the both the Surround Back Left and Right speakers (forming two mono Back Surrounds).

**Note:** Neo:6 does not include a Low Frequency Effects channel for the Subwoofer, but the 651R/751R can create a Subwoofer output via Bass management. Refer to the ‘Tone/Sub/LFE configuration’ section in the ‘Operating instructions’ part of this manual.

A DTS technology that provides 5.1 channels of 96kHz / 24bit audio (along with video if required) on DVD-Video and DVD-Audio (video zone) discs (when suitably encoded in DTS 96/24). DVD players which allow ‘DTS digital out’ pass the DTS 96/24 bitstream over S/P DIF or HDMI for decoding in the 651R/751R.

**DSP modes**

These modes allow a surround-sound experience from source material that has no encoding at all. The surround sound effect is achieved by Digital Signal Processing of the Analogue or Digital stereo source used. Two modes are possible: Movie and Music.

**Stereo/Stereo + Sub**

Only the Front Left and Front Right speakers (and subwoofer if selected) have output in this mode. If an analogue source is selected it will be converted to digital via 24 bit A/D converters to allow digital domain sub creation and bass/treble controls.

If a digital source is selected the 651R/751R will be processing either LPCM stereo (from the digital outputs of a CD player for instance) or a Stereo downmix of DD or DTS material (from the digital output of a DVD player for instance).

**Other modes**

**Analogue stereo direct**

Selects the analogue inputs for the current source directly with no A/D conversion, DSP processing, Bass/Treble or subwoofer channel active. Provides the very best fidelity for analogue Hi-Fi source equipment. In this mode the 651R/751R is acting just like a normal Hi-Fi integrated amplifier.

**Multi channel PCM**

Some playback devices (in particular Blu-ray players) are able to decode some of the above formats themselves internally and then output the decoded audio as Multi Channel PCM to the 651R/751R. In addition Blu-ray disks can support native unencoded Multi Channel PCM soundtracks (of up to 8 channels) on the disc itself. In either case if your player can output these over HDMI the 651R/751R is able to receive them in Multi-Channel PCM mode.

**Multi channel stereo**

For Stereo inputs the 651R/751R can if required create a multi-channel stereo presentation whereby the incoming Left and Right channels are output to the Front Left/Surround Left/Surround Back Left and Front Right/Surround Right/Surround Back Right channels respectively, The Centre is sent a L+R signal and a mono-ised Subwoofer channel is also created.
USB Audio (751R only)

The 751R is both USB 2.0 (Hi-Speed) and USB 1.1 (Full-speed) USB port compatible.

The 751R also supports two USB Audio protocols (not the same as the port types themselves) USB Audio 1.0 (which works over USB 1.1 ports and supports up to 24-bit/96kHz) or USB Audio 2.0 (which requires a USB 2.0 port and can support up to 24-bit/192kHz).

The default configuration is USB 1.1 and USB Audio 1.0 which works with nearly all common operating systems and computer types without drivers and supports up to 24-bit/96kHz audio, simply plug in and play.

In this configuration the 751R is able to work at up to 24-bit/96kHz by declaring to your computer that it can handle any sample rate from 32kHz to 96kHz.

However in some Windows/Mac operating system variants the operating system itself may restrict or fix the output sample rate or re-sample the audio.

See our online guide at www.cambridge-audio.com/751RSupport on USB Audio for more details. With careful choice of playback software and settings many pitfalls can be avoided.

In particular our free Windows USB Audio 2.0 driver (available from our website) supports up to 24-bit/192kHz audio and WASPI Exclusive or ASIO output either natively or via a plugin. One example of such an application with a suitable plugin is Foobar, see http://www.foobar2000.org for more details.

A brief explanation of your choices is below:

Switching between USB Class 1 and USB Class 2 operation

Your 751R will come set to driverless USB Audio Class 1.0 by default, but it can be configured to run in either USB Class Audio 1.0 or 2.0 mode. To change USB Class, navigate to the Advanced Audio Setup menu and select the USB Audio item.

Use with PCs

With the 751R switched to USB Audio 1.0 (this is the default setting) the 751R will work with the native Windows XP, Vista or 7 Audio 1.0 driver and accept audio up to 24-bit/96kHz.

With the 751R switched to USB Audio 2.0 the 751R needs the Cambridge Audio USB Audio 2.0 Driver to be loaded and can then accept up to 24-bit/192kHz (and support ASIO and WASAPI Exclusive if required).

The driver is available from www.cambridge-audio.com/751RSupport.

Use with Macs

No extra drivers are required. With the 751R switched to USB Audio 1.0 the 751R will work with the native Mac OS-X 10.5 (Leopard) or above Audio 1.0 driver and accept audio up to 24-bit/96kHz.

With the 751R switched to USB Audio 2.0 the 751R works with the native Mac OS-X 10.5 (Leopard) or above Audio 2.0 driver and can accept audio up to 24-bit/192kHz.

Use with Linux

For most distributions of Linux with the 751R switched to USB Audio 1.0 the 751R will work with the native Audio 1.0 driver and accept audio up to 24-bit/96kHz.

Some very new distributions of Linux are now supporting USB Audio 2.0 for which the 751R should be switched to Audio 2.0 support to accept audio up to 24-bit/192kHz.

For both cases because Linux distributions vary according to their creators choice of software components including drivers it is not possible to guarantee operation and Audio drivers may need to be loaded.

’Class drivers’ as they are called for generic support of Audio Class 1.0 or Audio Class 2.0 devices may be available from the Linux community, we do not supply these.

Bit perfect transfer – ASIO and WASAPI Exclusive mode

The 751R USB interface hardware and software support bit perfect transfer.

Whether or not the audio sent to the 751R is bit perfect (i.e. not resampled or mixed etc. by the PC) is actually a function of the playback application and the operating systems audio engine.

By default the standard windows audio drivers (often called WDM drivers) included in Windows XP support MME or DirectSound transfer, both of which include a kernel mixer and re-sampler stage.

One way round this is to use ASIO to bypass this. Another is to use a playback application that supports its own form of kernel streaming, i.e. if has its own way of outputting the audio without invoking the kernel mixer.

For Windows Vista and Windows 7 a new method of audio transfer is supported called WASAPI. This has two modes; Shared and Exclusive. Shared mode is similar to MME or DirectSound but in Exclusive mode the kernel mixer/re-sampler is bypassed and bit perfect transfer is possible with only one audio playback program directed to the soundcard at a time (for instance system sounds are not mixed in).

To ensure bit perfect transfer use a playback application that supports ASIO, WASAPI in Exclusive mode (if you have Windows Vista or Windows 7) or some form of kernel streaming.

This is a fast moving area so we would encourage you to check the web for the latest media players to support these more audiophile playback options.

To use ASIO you will need the Cambridge Audio Sound Driver installed and the 751R switched to USB Audio 2.0.

No further settings are required as the driver automatically supports ASIO transfer, all that is required is to load and setup suitable ASIO enabled playback software.

ASIO (Audio Stream Input/Output) is a non Microsoft audio driver protocol for Windows originally invented by Steinberg Ltd ASIO bypasses some of the normal audio path from the playback application through the Windows audio system (including the Kernel Mixer) for a more direct path to the 751R.

You will need to install and use a suitable playback application that supports ASIO output either natively or via a plugin. One example of such an application with a suitable plugin is Foobar, see http://www.foobar2000.org for more details.
Operating instructions

To activate the 651R/751R, switch the Power switch on the rear panel to On then press the Standby/On button on the front panel.

Selecting the source
1. Select the desired source by pushing the corresponding source button on the front panel or remote control.

2. If necessary, press the Audio Input Type button to select the input mode of the source equipment, either analogue, digital or HDMI (depending on the connection made on the rear panel). You may have already assigned this in the ‘Audio In/Out Setup Menu’ in the OSD.

The digital, analogue or HDMI icons on the display show which is the currently selected input type.

Note: The 651R/751R stores the input type for each source so that it is automatically recalled when that source is selected again.

Selecting the desired listening mode
Select an appropriate mode for the source material/type you are listening to by pressing the Stereo or Surround Modes button and cycling through sub-modes where available.

In all cases the first time a mode button is pressed the 651R/751R will report the current decoding mode on the front panel display. Pressing the button again will then cycle to the next available mode (if there is one). If no button is pressed for 4 or 5 seconds the 651R/751R returns to normal operation without changing mode.

Stereo Modes - Selects 2 channel Stereo operation for stereo material, pressing again selects Stereo + Sub mode.

This is a digitally processed mode that allows bass and treble controls, and sub generation if required. The input can be either analogue (in which case it will be turned into digital by 24 bit A/D conversion) or natively digital.

Surround Modes - Selects a range of digital surround modes for the appropriately digitally encoded material

Note: Some Surround Sound types (such as the Dolby and DTS HD) are available only from Blu-ray disc over HDMI.

Pressing the Surround Modes button will cause the 651R/751R to lock onto the incoming bitstream and select the first available mode for the current bitstream type.

In some circumstances (see tables) pressing the button again will switch to an alternative decoding option.

Dolby Pro Logic and Neo:6 are both available in various guises to decode appropriately encoded soundtracks. Additionally DSP modes are available to process sources with no encoding at all. Due to the matrix encoding process none of these modes incorporate flags that tell the 651R/751R the type of encoding used in the source material. Thus you must manually select these modes.

Pressing the Surround Modes button when the 651R/751R has locked to a DD/DTS bitstream will present more options where possible including Post-Processed modes.

These are modes that allow extra processing to be applied after the main surround-sound decoding. For instance Dolby Digital (2/0) + Dolby Pro Logic II Music. Which adds a 5.1 Dolby Pro Logic decode to a Stereo Dolby Digital decode to turn 2 channel stereo into 5.1.

For 7.1 Speaker setups, the number of decoding possibilities increases as shown in the following ‘Decode modes’ tables. Several extra Post Processing modes are available using either Dolby Pro Logic IIx or Neo:6.

Incoming Dolby Digital/DTS streams are always shown on the front panel display as Dolby Digital (x/x).x or DTS (x/x).x, where the bracketed numbers indicate the active channels in the source material. Active output channels are shown by the icons on the right hand side of the front panel display. Possible incoming DD/DTS types are:

(1/0) - Mono, Centre channel only
(2/0) - Left/Right stereo
(2/0).1 - Left/Right stereo and LFE (Sub)
(2/2) - Left/Right stereo and Left/Right surround
(3/0) - Left, Centre, Right
(3/0).1 - Left, Centre, Right and LFE (Sub)
(3/2).1 - 5.1: Left, Right, Centre, Left Surround, Right Surround and LFE (Sub)
(3/4).1 - 7.1: Left, Right, Centre, Left Surround, Right Surround, Surround Back Left, Surround Back Right and LFE (Sub)

When the source has been appropriately encoded Dolby Pro Logic II gives 5 channel Neo:6 6 channel and Dolby Pro Logic Ix 7 channel matrix encoding.
## Decode modes - 7.1 speaker setup

**Incoming audio format** | **Native channel resolution** | **Modes available** | **Output channels**
---|---|---|---
Dolby Digital Plus | 5.1 | Dolby Digital Plus (3/2).1 Upmix | >7.1
Dolby Digital Plus | 5.1 | Dolby Digital Plus (3/2).1 | 5.1
Dolby Digital Plus | 5.1 | Dolby Digital Plus (3/2).1 + Dolby Pro Logic IIx Movie | >7.1
Dolby Digital Plus | 5.1 | Dolby Digital Plus (3/2).1 + Dolby Pro Logic IIx Music | **7.1**
Dolby Digital Plus | 7.1 | Dolby Digital Plus (3/4).1 | **7.1**
Dolby True HD | 5.1 | Dolby True HD (3/2).1 Upmix | >7.1
Dolby True HD | 5.1 | Dolby True HD (3/2).1 | 5.1
Dolby True HD | 5.1 | Dolby True HD (3/2).1* + Dolby Pro Logic IIx Movie | >7.1
Dolby True HD | 5.1 | Dolby True HD (3/2).1* + Dolby Pro Logic IIx Music | **7.1**
Dolby True HD | 7.1 | Dolby True HD (3/4.1) | **7.1**
DTS HD High Resolution | 5.1 | DTS-HD HR (3/2).1 Remap | >7.1
DTS HD High Resolution | 5.1 | DTS-HD HR (3/2).1 | **5.1**
DTS HD High Resolution | 7.1 | DTS-HD HR (3/4.1) | **7.1**
DTS HD Master Audio | 5.1 | DTS-HD MA (3/2).1 Remap | >7.1
DTS HD Master Audio | 5.1 | DTS-HD MA (3/2).1 | **5.1**
DTS HD Master Audio | 7.1 | DTS-HD MA (3/4.1) | **7.1**

* <=96kHz

**Key (all tables)**
- 5.1< Indicates a 5.1 decode of 6.1 or 7.1 material (phantom back centre).
- >5.1 Indicates a 5.1 output created by a 2.0 decode post processed to 5.1.
- >7.1 Indicates a 7.1 output created by a 2.0 or 5.1 decode, post-processed to 7.1.
- 5.1< H Indicates a 5.1 decode of incoming height encoded formats.
- 7.1 ‘Upmix’ of 5.1 material, Left and Right Surrounds mixed to both Left and Right Surrounds and Left and Right Rear Surrounds.
- 7.1 ‘Upmix’ of 6.1 material. Center back surround channel played back via two mono rear surrounds. Acoustically this is actually a native format presentation.
- Stereo or Stereo + Sub, Press Stereo Modes Button to change.
- Digital Signal Processing created modes for signals with no encoding.
- Available via HDMI inputs only.
- Lossless encoded format.

**MCS** - Multi Channel Stereo, L and R output via all Left and Right channels plus a Centre channel and subwoofer mix are created.

In all cases, pressing the Stereo Modes button always cycles round:

<table>
<thead>
<tr>
<th>Stereo Modes</th>
<th>Output channels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stereo</td>
<td>2</td>
</tr>
<tr>
<td>Stereo + Sub</td>
<td>2.1</td>
</tr>
</tbody>
</table>

Either native Stereo or downmix of DD/DTS 5.1/6.1/7.1 etc.

Pressing a mode button will first cause the 651R/751R to scroll the current decode mode across the front panel display. Pressing the mode button again whilst text is scrolling on the display or within 4 seconds of it finishing will select and display the next available mode.
Using the tuner

Audio Return Channel

The 651R/751R supports an Audio Return Channel (ARC) function from TVs that also support this function (which must feature an HDMI 1.4 input and have actually implemented the ARC feature, see your TV's manual).

ARC allows a TV to send audio back down its incoming HDMI lead to the 651R/751Rs HDMI A output socket.

This function allows the 651R/751R to play back the audio from a TV's built-in terrestrial cable or satellite tuner whilst you watch it's picture.

Using ARC

The ARC must first be enabled in the Advanced Audio Setup menu.

To finish ARC simply disengage it on your TV or press a different source button on the 651R/751R.

Picture adjustment

For sources that have had the Scaler set to Process the 651R/751R can provide some picture adjustments.

These adjustments are remembered source by source.

Pressing a source for which the scaler is set to Bypass will do nothing.

Pressing a source for which the scaler is set to Process will bring up the first adjustment item, shown at the bottom of the screen as below:

Setting the Lip sync value to 0 causes Lip Sync delay to be turned off.

Note: The Lip sync value is stored and recalled separately for each source.
You can use the Volume knob or the \(\uparrow/\downarrow\) buttons to make changes to the picture or press the Pic Adj. button again to move to the next item.

Adjustments are available for Brightness, Contrast, Saturation, Sharpness and Y/C Delay.

A second feature of the Picture Adjustment button on the unit’s front panel is setting the output resolution for the scaler (this can also be done in the OSD see earlier section).

If the front panel (not remote) button is pressed and held for approx. 10 seconds the 651R/751R will show the current scaler output resolution on the 651R/751R’s front panel display. Holding for a further 10 seconds will change the output resolution to the next available one (and allow time for the TV to re-sync).

Holding further will continue the process and the video output will gradually move through all possible resolutions 480p 60Hz, 576p 50Hz, 720p 50Hz, 720p 60Hz, 1080i 50Hz, 1080i 60Hz, 1080p 50Hz and 1080p 60Hz (and back round).

This feature can be useful if the scaler output is accidentally set to a resolution your TV does not support and picture is lost.

By pressing and holding the Pic Adj. button, you can cause the 651R/751R to scroll through all resolutions automatically. Simply let go of the button when a visible video image at a suitable resolution appears.

Audio split mode

In some circumstances the 651R/751R is able to allow the user to view one source whilst listening to another. For instance you could watch the video of a sports channel whilst getting an audio commentary from another such as the Tuner.

To perform Audio Split:

1. Select the source you wish to watch in the normal way.
2. Press and hold the button on the front panel (not remote) for the source you wish to listen to. After 4 seconds approx “Audio Split” will scroll across the display and you will now be listening to that source instead. Video will not have changed.

The 651R/751R allows splitting from any source whatever its video input type (Composite, S-Video, Component or HDMI) but only to sources where analogue or digital audio is the current audio input type, not HDMI.

If the combination is not allowed “Mode Unavailable” will instead scroll across the display and no change will be made. To cancel audio split mode simply select a new source and normal operation will be resumed.

HDMI A and B outputs

The 651R/751R has two HDMI outputs allowing the connection of two TVs or a TV and projector etc. Both outputs show the same picture. HDMI A also features an Audio Return Channel for TVs that feature this (see earlier section).

To switch between only HDMI A active, HDMI B active or HDMI A and B both active select the HDMI/Component Assign menu in the OSD and highlight the HDMI Out menu item. Use the left and right buttons to scroll through the options.

Alternatively, press and hold the Pic Adj. button when the OSD is on, scrolls the output from HDMI A to HDMI B to HDMI A+B and so on.

Note: The 651R/751R also shows the active HDMI outputs on the front panel display of the unit itself whenever the OSD is on. This is so you can still see what the active outputs are even if the OSD disappears if you turn off the HDMI output you have connected to your TV.

HDMI Bypass

The 651R/751R features an HDMI bypass mode that copies the incoming HDMI to the output without internal reception or processing.

This does not necessarily mean all future standards will pass through however if they use new pixel clock rates or bit depths that the 651R/751R HDMI 1.4 chipset cannot support.

This feature has been included to allow some measure of compatibility with any future unsupported audio/video formats as they can be sent directly to the TV/Projector.

It can also be useful if you have a TV with built in speakers and would like to send the incoming source to the TV for decoding rather than have the 651R/751R do the decoding.

To select HDMI Bypass select the Advanced Setup menu from the main OSD screen, then the Advanced Audio menu and highlight the HDMI Bypass menu item.

Uses the Up/Down buttons to switch between Normal (HDMI reception) and Bypass modes.

Trigger Outputs

The 651R/751R feature two trigger outputs that can be used to signal to external devices for simple automation functions.

Examples might be using the Triggers to open or close curtains, tell a projection screen to roll up and down or turning on/off external power amps etc.

The outputs are 0V for Off and 12V for On at up to 100mA. The connections are 3.5mm mono mini-jacks, with the tip as the output, ring as ground.

To choose how the triggers operate select the Advanced Setup menu from the Main Menu, then select the Trigger A (or Trigger B) menu item, the options are:

Manual Select: Yes/No – When enabled the trigger output can be toggled On and Off by the matching Trigger button on the remote control.

If disabled these buttons will have no effect.

Note: When enabled the remote buttons can be used to toggle the outputs (override the status) even if they are also following the status of a zone or source selection as below.

Follow Standby: Yes/No/Zone 2 – this means the trigger output can follow the On/Off status of the Main Zone or alternatively that of Zone 2.

Sources: Yes/No – the trigger output can be made to go high when one or more specific sources is selected.

Note: Follow Standby and selecting any Sources are mutually exclusive options.
Bi-amping

If you are running a 5.1 (or less) speaker setup, the 651R/751R allows for bi-amping of the front left and right channels. It will be seen in the Speaker Configuration menu that with the Decode mode set as 5.1 a Bi-amp On/Off item appears.

Speaker Config Menu

<table>
<thead>
<tr>
<th>Decode Mode</th>
<th>S.L</th>
</tr>
</thead>
<tbody>
<tr>
<td>Front L/R</td>
<td>Large</td>
</tr>
<tr>
<td>Centre</td>
<td>Large</td>
</tr>
<tr>
<td>Surr. L/R</td>
<td>Large</td>
</tr>
<tr>
<td>Subwoofer</td>
<td>Yes</td>
</tr>
</tbody>
</table>

When selected, the 651R/751R sends the front left and right signals to the SBL and SBR outputs as well.

In conjunction with bi-wireable/bi-ampable speakers this allows you to use two runs of speaker cable to each speaker with a dedicated amplifier channel for the bass and treble drivers of each speaker which can slightly increase the sound quality.

See diagram below of a bi-amped system (only front left and right speakers shown).

Note: Bi-wire links must be removed on the speaker’s terminals.

Tone/Sub/LFE configuration

Select the ‘Tone/Sub/LFE Menu’ from the main menu:

The Bass response can be adjusted +/- 10dB @ 100Hz (shelving). The Treble response can be adjusted +/-10dB @ 10kHz (shelving).

The 651R/751R incorporates a couple of advanced Bass Management features. The overall Sub Level for DD/DTS modes, Dolby Pro Logic II/IIx/Neo:6 modes and Stereo + Sub mode can be set to different levels. This can be useful if you prefer to have a high level of Sub operation whilst watching movies but a lower level for music playback. The three levels are simply adjusted by up to +/-10dB in the OSD. The second feature is that the way Bass Management is applied can be changed.

In normal operation (Bass Augment Off) if the Front speakers are set to ‘Large’, bass from the Front Left and Right is now sent to the Sub channel (i.e. bass is removed from the Fronts and sent to the Sub). If they are set to ‘Large’ no filtering takes place and no bass is sent from them to the Sub channel.

However with the Bass Augment function On and the Front speakers set to ‘Small’ (in the ‘Speaker Config’ menu) their bass is re-directed by high-pass filtering the Fronts and sending that bass to the Sub channel (i.e. bass is removed from the Fronts and sent to the Sub). If the Front Left and Right are set ‘Small’, Bass Augment has no effect and operation is the same as for Bass Augment Off.

Bass Augment can be On or Off separately for DD/DTS or Dolby Pro Logic II/IIx/Neo:6 operation.

There is no Bass Augment function for Stereo + Sub mode because in this mode if the Front speakers are set to ‘Large’ they will actually always be unfiltered.

Bass Augment can be a useful function with Dolby Pro Logic II/IIx and Neo:6 material because these encoding types do not include an LFE Channel. This would normally mean that if all the speakers in your setup were set to ‘Large’, the subwoofer would in fact be inactive (as no bass has been re-directed plus there is no LFE channel). If it is desired to have the subwoofer running with all large speakers and these encoding types, enable Bass Augment for Dolby Pro Logic II/Neo:6 and then set the Crossover points and levels by ear. A Sub channel will now be created from the Front Left and Right channels without filtering them. As with all adjustments it is a good idea to experiment to determine what works best with your particular setup.

Note: These adjustments work in all digitally processed Stereo or Surround modes but not in Analogue Stereo Direct or 7.1 Direct modes.

The LFE channel (for DD / DTS material) can also be trimmed by up to 10dB in 1dB steps useful for late night listening or other situations where it might be desired to reduce the low frequency effect level perhaps temporarily.

Remember the LFE is the Low Frequency Effects channel encoded into the disc and is different to the overall sub level which can include bass management from the other speakers.

Bass/Treble adjustments can also be made from the remote without entering the OSD by pressing the Bass/Treble button and then using the Vol Up/Down buttons.

Recording

The 651R/751R features two recorder outputs.

Recorder 1 features analogue audio, co-axial digital audio, composite and S-Video outputs.

In all cases the 651R/751R does not convert between the formats, it merely outputs the signals present at the corresponding inputs for the chosen source.

The chosen source is simply the one that is being listened to via the 651R/751R main outputs.

Recorder 2 features analogue audio and co-axial digital audio outputs.

Again the 651R/751R does not convert between the formats, it merely outputs the signals present at the corresponding inputs for the chosen source.
All three adjustments are a matter of personal preference, experiment for the settings that you prefer when you are using Dolby Pro Logic II or Dolby Pro Logic Ix decoding.

Dynamic range control

This setting controls the dynamic range of Dolby Digital movie soundtracks by compressing the audio to limit the difference in level between loud and quiet passages in the movie.

This can be a useful feature when watching movies late at night for instance.

Three settings are possible:

- **Auto** – Compression is always applied for Dolby Digital and Dolby Digital Plus soundtracks. The application and amount of compression to Dolby True HD soundtracks is dictated by the soundtrack itself.
- **Off** – No Compression (normal full dynamic range playback)
- **On** – Compression is always applied for all Dolby soundtracks (reduced dynamic range playback).

Source Naming

It is possible to change the default source names as displayed on the units front panel display.

To edit a source name highlight it in the OSD and press Enter then use the volume Up/Down buttons on the remote to change each character.

Pressing the enter button on the remote moves to the next character or you can use the < and > buttons to step forward or back a character at a time.

Once you are finished press the (I/0) button to save the current source name.
Using the 651R/751R with an IR repeater system

If desired the 651R/751R can be mounted in a suitably well ventilated cabinet and an IR repeater system used to control the unit remotely.

Both an IR Emitter input (suitable for IR repeater systems with modulated IR emitter outputs) and an IR Receiver input (suitable for IR repeater systems with un-modulated TTL level outputs) for the Main Zone are featured.

A Front IR On/Off switch on the rear panel allows the disabling of the front panel IR receiver if desired.

Zone 2 setup and use

The 651R and 751R features a set of Zone 2 outputs which can independently access stereo audio/video sources connected to the unit via a range of analogue connections.

Digital inputs (S/PDIF/Co-ax, Toslink/Opto or HDMI) cannot be directly selected by Zone 2.

However for any source simply by making a parallel analogue connection for audio or video to the 651R/751R alongside any digital connections allows that source to now be used in Zone 2 also.

Sources directly selectable in Zone 2 are BD/DVD, Video 1, Video 2, Rec 1, Aux, CD, Rec 2, Vid 3/Mp3 plus the Expansion input and the built-in Tuner.

There is also a Follow Main function. This sends a 2 channel down-mix (L+C, R+C) of the source currently selected in the Main Zone to Zone 2.

This is useful if you want to listen to a digitally connected or surround source in Zone 2 which cannot be directly selected in Zone 2.

You can choose to watch the same source as the main room or a different source, Zone 2 can also be On or Off (in standby) whether or not the main room output is On or Off (in standby).

The audio output can be either by using the Surround Back Left and Right channels if they are not being used in the main room (if the main room is configured as 5.1 or less) or by using the Zone 2 preamp outputs and an external power amp. The Zone 2 video output can be via Composite (CVBS), S-Video or Component (YUV/YCbCr/YPbPr).

Note: The 651R/751R does not transcode between analogue video types for Zone 2, the three types are switched in parallel.

Using Zone 2 with the built in SBL/SBR amplifier outputs

If you are using only the 5 main outputs in the main Zone (or less) you can reassign the SBL/SBR amplifier channels to Zone 2.

In the On-Screen Display select the Speaker Setup menu.

Then select the Speaker Configuration menu.

Now select the Decode Mode item and select 5.1.

A menu item should be displayed called SBL/R Assign.

When they are not being used in the main room (for a 7.1 speaker setup) this function allows the SBL/R channels to be re-assign to bi-amping the front channels (Bi-amp see later section) or Zone 2 or simply not used (None).

Select Zone 2 use and go back out of the menu structure.

Now connect a suitable pair of loudspeakers (4-8 ohms) for Zone 2 as shown below to the SBL and SBR outputs.

Note: Be careful no small ‘hairs’ or strands of wire are able to short the loudspeaker terminals together or short them to the back panel.

Optionally a Subwoofer can also be used in Zone 2, simply connect a suitably long RCA/Phono – RCA/Phono lead from the Zone 2 Sub out to the subwoofer in Zone 2.

Using the 651R/751R with an IR repeater system

If desired the 651R/751R can be mounted in a suitably well ventilated cabinet and an IR repeater system used to control the unit remotely.

Both an IR Emitter input (suitable for IR repeater systems with modulated IR emitter outputs) and an IR Receiver input (suitable for IR repeater systems with un-modulated TTL level outputs) for the Main Zone are featured.

A Front IR On/Off switch on the rear panel allows the disabling of the front panel IR receiver if desired.

Control Bus In/Out also allow some Cambridge Audio products which feature App. control such as the StreamMagic 6 Network Player to control the basic functions of the 651R/751R remotely.

Contact your dealer for details.
With this configuration you can now control Zone 2 from the main room by using the main or Zone 2 handsets as supplied (see later section).

If it is desired to remotely control Zone 2 and the sources in it from Zone 2 itself an additional (not supplied) IR repeater system should be used, choose one with an Emitter (modulated) type output suitable to connect to the Zone 2 IR emitter In (contact your dealer for details).

In this configuration an Infra-Red repeater system receives commands in Zone 2 and relays them back to the 651R/751R via the Zone 2 IR Emitter In. Now you can control Zone 2 from within that Zone using either the Zone 2 or main handsets. In addition if IR Emitters outputs are connected from the Zone 2 IR Emitter Outputs on the 651R/751R to the source components (usually placed over the source units IR sensors) then commands from remotes in Zone 2 can be relayed back to the source components.

The sources own handsets plus the Zone 2 or main handsets can be used in Zone 2 or a learning type remote can be used to combine all the functions together.

Using Zone 2 with an external stereo power amp.

The 651R/751R Zone 2 outputs include a permanently available preamp output. This can be used to connect a separate power amp in Zone 2 if for instance the SBL/SBR amplifier channels are being used in the main zone.

Optional a Subwoofer can also be used in Zone 2 as shown, simply connect a suitably long RCA/Phono – RCA/Phono lead from the Zone 2 Sub out to the subwoofer in Zone 2.

The Zone 2 preamp output is unaffected by the assignment of the SBL/R channels and is always available.

If a power amp is used for Zone 2 the SBL/SBR amplifier channels can then be used for 7.1 (Set decode mode to 7.1) or Height channels (set decode mode to 5.1+H) or to bi-amp the front channels (Set decode mode to 5.1 and Set SBL/R assign to Bi-amp) or simply leave them unconnected (Set decode mode to 5.1 and Set SBL/R assign to None).

If the remote Zone 2 power amp features a trigger input to turn it on and off it is possible to use one of the 651R/751R trigger outputs for this. Connect a suitably long 3.5mm mono jack 3.5mm mono jack lead from the Trigger A or Trigger B output as shown.

To set the Trigger output to follow Zone 2 select Advanced Setup in the OSD then Trigger A (or B).

Now select Follow Standby and select Zone 2. The trigger output will now be active (high) when Zone 2 is On and inactive (low) when Zone 2 is Off.

Note: The Trigger menu also allows for Manual Select (i.e. the trigger toggles each time the Trigger A (or B) button is pressed on the main remote handset. If you want to disable this function and have the trigger only follow the Zone 2 on/off status ensure that Manual Select is set to No. See the Trigger menu section for full details.

Controlling Zone 2 from the main room

Controlling Zone 2 Components

From the main room you can use the main remote handset or the buttons on the front of the unit itself and operation is the same in either case.

First press the Zone 2 button on the front panel or remote then another button for a function you wish to affect Zone 2 within 5 seconds.

If a command is not received within 5 seconds the unit will return to normal operation.

To turn on Zone 2 press the Zone 2 button followed by the Standby/On button within 5 seconds.

When Zone 2 is pressed the display will initially show Zone 2 : Off once Standby/Off is pressed the display will change to show Zone 2 : BD/DVD or whatever was the last source used in Zone 2.

To turn off Zone 2 simple press Zone 2 followed by the Standby/Off button again.
Zone 2 continued

To select Tuner in Zone 2, press Zone 2 followed by the Tuner button.
Do this again to switch from AM to FM or vice versa.
To select other sources in Zone 2 press Zone 2 followed by the desired source button.
To select the same source as the main room’s, press Follow Main.
To change the volume is Zone 2 press Zone 2 followed by the volume up or down buttons (or volume knob).
To mute Zone 2 press Zone 2 followed by the Mute button.
You can also use the Zone 2 handset in the main room to control Zone 2.
In this case all the remote commands automatically control Zone 2, simply point the Zone 2 handset at the main unit and use the Standby/On or source buttons to always control Zone 2 operation.

Note: The Zone 2 handset has a couple of special features.
Using the [< or >] preset up down buttons for the Tuner will always automatically put the tuner into Preset mode (as opposed to Manual or Automatic modes).

Note: The Tuner will also only scroll through Presets that have actually been set.
The Zone 2 remote has a Follow Main function. This forces Zone 2 to follow the same source selection as the main zone. This can be useful in that Zone 2 can now receive any audio type including digital or HDMI audio that is being decoded for the main zone. The Zone 2 outputs are created from Left + Centre and Right + Centre so that centre channel dialogue can be heard in Zone 2.

It is also possible to control Zone 2 via the On Screen Display.
From the main OSD screen select the Rec.2/Zone 2 Output Select menu and then select the Zone 2 menu item.

DTS-HD speaker re-map

As there is no “official” speaker layout for discrete 7.1 channel audio it could be possible that the original master track of a 7.1 soundtrack was mastered with a different speaker layout than the one being used in your home. DTS have addressed this issue for DTS-HD Master Audio and High Resolution Audio by including in the bitstream flags to tell the receiving AV Receiver which of a 7 nominal 7.1 speaker layouts was actually used. By using special DTS Speaker Remap algorithms the 651R/751R is able to electronically “reposition” the speakers (i.e. direct the audio propagation), so that the playback matches the original encoded layout for the best possible sound quality.

A second aim of this technology is that by re-purposing some of the 7.1 available channels it is possible to use some of them to do new things such as adding a height element to the sound field.

The following digrams show the 7 possible encoding schemes for reference.
The angles quoted refer to the angle from a nominal 0 degrees line through the centre channel to each speaker either side right or left of that line.

Configurations 1 and 5 are variants of normal 7.1 setups whilst Configuration 6 can increase the available panning of the front channels.
Configurations 2, 3, 4 and 7 are less conventional and re-purpose some of the available 7.1 channels to provide an extra height dimension to the sound field in different ways. Configuration 4 is the one the 651R/751R expects if you choose to use a 5.1 + Height speaker setup. Please refer to the DTS website for more details on this new technology.

**Configuration 1** - 7.1 channel: L, C, R, LFE, Lss, Rss, Lsr, Rsr

**Configuration 2** - 7.1 channel: L, C, R, LFE, Ls, Rs, Lhs, Rhs

**Configuration 3** - 7.1 channel: L, C, R, LFE, Ls, Rs, Cs, Oh

Controlling Zone 2 from Zone 2 itself

As previously described you will need an IR repeater system in order to do this.
This allows commands received in Zone 2 to be relayed back to the Zone 2 IR Emitter Input on the back of the unit.
Via such a repeater you can use both the main and Zone 2 handsets in Zone 2. For both handsets all commands received will automatically affect Zone 2.
i.e. for the main zone handset when used in this way in Zone 2 you do not need to press Zone 2 followed by another command. Simply select a source or mute etc. and the unit will automatically do that function in Zone 2.

azur 651R Main Menu
Speaker Setup
HDMI/Component Assign
Video Input Select
Scaler Assign
Video Processing Settings
Audio Input Select
Tone/Sub/LFE Config.
Rec.2/Zone2 Output Select
Advanced Setup
Quit I/O

Use the < and > buttons on the remote scroll to through the various sources available, Follow Main and Off.

Controlling Zone 2 from Zone 2 itself

As previously described you will need an IR repeater system in order to do this.
This allows commands received in Zone 2 to be relayed back to the Zone 2 IR Emitter Input on the back of the unit.
Via such a repeater you can use both the main and Zone 2 handsets in Zone 2. For both handsets all commands received will automatically affect Zone 2.
i.e. for the main zone handset when used in this way in Zone 2 you do not need to press Zone 2 followed by another command. Simply select a source or mute etc. and the unit will automatically do that function in Zone 2.
Configuration 4 - 7.1 channel: L, C, R, LFE, Ls, Rs, Lh, Rh

For playback, the 651R/751R expects you to have an actual physical speaker setup approximately conforming to one of the layouts as shown below.

Configuration 5 - 7.1 channel: L, C, R, LFE, Ls, Rs, Lsr, Rsr

Configuration 6 - 7.1 channel: L, C, R, LFE, Ls, Rs, Lw, Rw

Configuration 7 - 7.1 channel: L, C, R, LFE, Ls, Rs, Ch, Cs

For 5.1 setups the situation is simple, the 651R/751R automatically performs any DTS speaker remapping required, mapping any of the 7 incoming possibilities to this configuration.

For 5.1 + Height the 651R/751R also automatically performs DTS speaker remapping, mapping the incoming possibilities to configuration 4.

For 7.1 there are two alternative speaker setup you might have. These corresponds to configuration 1 and configuration 5 as above.

Here you need to tell the 651R/751R which configuration best matches your speaker setup by selecting the DTS-HD speaker menu and selecting the 1 or 5 option.

When 5.1 + Height has been selected, the DTS HD Spkr Remap function will be permanently set to Configuration 4 as you would expect.

Also note that where the incoming speaker configuration and your physical speaker configuration actually match the 651R/751R performs no extra mapping as you'd expect.
Auto Power Down

The 651R/751R feature automatic power down and will by default shut down if no audio playback has been detected for 30 minutes. This feature can be enabled or disabled in the Advanced Audio Setup menu, select the Auto Power Down item and press the < or > buttons on the remote to change.

Custom installation (C.I.) use

An IR Emitter Input is provided that allows modulated IR remote control commands to be received electrically by the unit. An IR receiver input and Control Bus connections, similarly allows unmodulated commands to be received. An RS232 port is also featured which allows the 651R/751R to be controlled by C.I. systems.

In addition the unit features ‘direct’ IR/Control codes as well as toggle codes for some features to simplify programming custom installation systems. Special direct On/Off and Mute On/Off commands can be accessed on the supplied remote control for teaching into C.I. systems as follows:

1. Press and hold the Standby/On button on the remote control. The remote first generates it’s standby (toggle) command. Keep the button held down, after 12 seconds an AV receiver “On” command will be generated. If the button is kept held down for a further 12 seconds, an AV receiver “Off” command is generated.

Repeat this procedure with the Mute and Stereo/Mono buttons to send On/Off commands. The Tuner AM/FM button also provides unique FM and AM commands to allow switching to a specific band.

A full IR code table and RS232 protocol for this product is available on the Cambridge Audio website at www.cambridge-audio.com.

Reset/Back-up memory

The 651R/751R has a function that preserves the preset memory and other settings. In the event of a power failure, or if the power cord of the unit is disconnected from the mains outlet, the back-up memory will preserve the preset memory.

If it is desired to reset all settings to their factory defaults (or in the unlikely event that the unit locks up due to an electrical discharge etc), with the unit on (out of Standby) press and hold the BD/DVD and Analogue Stereo Direct buttons on the front panel at the same time for three seconds.

“RESET” will appear briefly on the front panel display and all settings will be erased.

Troubleshooting

A low hum or buzz sound can be heard
Power cords or lighting placed near this product.

Analogue inputs not connected securely.

Sound is not audible from one channel
Speaker connections disconnected.

Speaker set to “None” in OSD setup menu.

Sound cuts off when listening to music or there is no sound even though power is ON
Speaker impedance is less than prescribed for the 651R/751R.
The unit is not adequately ventilated and may be overheating.

Low bass or “phasey” response
Speaker polarity (+/-) of one or more speakers is reversed.

An unusual hissing noise is heard when listening to a radio broadcast in stereo, but not heard when listening in mono
A slight noise may be heard because the method used for modulation of FM stereo broadcasts is different than that used for mono broadcasts.

Aerial quality also effects the level of hiss heard.

Noise is excessive in both stereo and monaural radio broadcasts
Poor location and/or direction of the antenna.

Transmitting station is too far away.

No sound from the rear speakers
Source being played is not recorded in surround sound.

Speaker/s set to “None” in OSD setup menu.

A stereo mode has been selected.

No sound from the centre speaker
Centre speaker has been set to “None” in OSD setup menu.

No sound from the subwoofer
Sub has been set to ‘Off’ in the OSD setup menu or via the remote.

DTS Neo:6, DD Dolby Pro Logic II/Ix modes (which have no LFE channel) have been selected with all speakers set to “Large” (and bass augment off).

Remote control is not working
The batteries are flat.
The remote is too far from the receiver or out of the effective range.

No sound from speakers when connected to a digital input or HDMI
Audio input type is set to analogue (check display). Press the Audio Input Type button to switch to digital or HDMI.

No sound from speakers when connected to an analogue input
Audio input type is set to digital. Press the Audio Input Type button to switch to analogue (check display).

Audio input type can also be set in the Input/Output Setup menu of the OSD.

No sound from any speakers
Receiver is set for ‘Pre-out’ operation.

By entering the OSD menu, selecting the input/output setup menu, the Preamp out setting can be changed from ‘Normal’ to ‘Pre-out’. This disables the internal amplifiers when an external decoder amplifier is being used. Reset this to ‘Normal’ to restore sound.

No sound from front speakers, but rear speakers work
Receiver is set for ‘Ext 2Ch’ operation.

By entering the OSD menu, selecting the input/output setup menu, the Preamp out setting can be changed from ‘normal’ to ‘Ext. 2 Ch’. This disables the internal amplifiers for the front channels when an external amplifier is being used to drive those channels. Reset this to ‘Normal’ to restore sound.
Technical specifications

**Audio**

**Power Output**

*651R*
- All Channels: 175 watts rms per channel, 6 ohms (two channels driven)
- All Channels: 140 watts rms per channel, 8 ohms (two channels driven)
- All Channels: 100 watts rms per channel, 8 ohms (all 7 channels driven)

*751R*
- All Channels: 200 watts rms per channel, 6 ohms (two channels driven)
- All Channels: 170 watts rms per channel, 8 ohms (two channels driven)
- All Channels: 120 watts rms per channel, 8 ohms (all 7 channels driven)

**THD**
- <0.006% @1kHz

**Crosstalk**
- <80dB

**Frequency response**
- 10Hz - 20kHz ±1dB

**S/N Ratio**
- >90dB 'A' weighted

**Audio Input Impedance / Sensitivity**
- 47kOhms / 175mV or greater

**Digital Input Impedance**
- 75 ohms (Coaxial/S/P DIF)

**Tone Control**
- Bass: ±10dB @ 100Hz
- Treble: ±10dB @ 10kHz

**Tuner**
- FM mode: 87.5-108MHz
- AM mode: 522-1629kHz

**Video**

**Video Levels /Impedance**
- Composite (CVBS): 1Vp-p / 75 ohm
- S-Video (S-VHS): Y 1Vp-p / 75 ohm, C 0.286 Vp-p / 75 ohm
- Component: Y 1Vp-p / 75 ohm, Cb/Cr 0.75Vp-p / 75 ohm, Pb/Pr 0.75Vp-p / 75 ohm

**HDMI**
- HDMI 1.4a *
- EIA/CEA - 861D
- HDCP 1.1

* Except 751R front panel HDMI which is 1.3c.

All audio modes supported except reception of native Direct Stream Digital (DSD).

3D-TV/deep colour pass through supported.

ARC supported on HDMI Output 'A'.

CEC and HEC not supported.

**General**

**Architecture**
- Cirrus Logic CS43122 24 Bit 192kHz capable DAC for Front Left & Right
- Cirrus Logic CS52526 24 Bit 192kHz capable CODEC for surround channels + 24 Bit 2 channel A/D conversion
- Two TI Aureus DA788 32 Bit DSPs
- Anchor Bay ABT2010 video scaler

**USB Audio 1.0:**
- 16-24 bit 32kHz, 44.1kHz, 48kHz, 88.2kHz, 96kHz

**USB Audio 2.0:**
- 16-24 bit 32kHz, 44.1kHz, 48kHz, 88.2kHz, 96kHz, 192kHz

**Audio Inputs**
- 8 Line Level Analogue, Tuner (FM/AM), Expansion, 7.1 Analogue Input, 5 Digital Co-axial, 5 Digital Optical

**Video Inputs**
- 4 Composite, 4 S-Video, 3 Component Video

**HDMI Inputs**
- 651R: 4 HDMI (1.4a)
- 751R: 5 HDMI (1.4a) + 1 HDMI (1.3c) on the front panel.

**Main Audio Outputs**
- 7 Amplified Speaker Outputs
- 7.2 Preamp outputs

**Main Video Output**
- 2 x HDMI (1.4a), ARC through HDMI A

**Recording Audio Outputs**
- 2 Line Level Analogue, 2 Digital Co-Axial, 2 Digital Optical

**Recording Video Outputs**
- 1 Composite, 1 S-Video

**Tuner connections**
- FM: 75 ohm coaxial aerial
- AM: 300 ohm loop aerial

**Other connections**
- 1 ¼" / 6.35mm Headphone Output (32 To 600 ohms recommended)
- 3 IR Emitter Outputs
- 1 IR Receiver Input (un-modulated)
- 1 IR Emitter Input (modulated)
- 1 Control Bus Input / Output
- 1 RS232C
- 1 IEC type mains inlet

**Trigger outputs (A&B)**
- Off: 0v, On 12v @ 100mA max.
- Tip - output, Ring - ground

**Zone 2**
- 2.1 Preamp Output
- 1 Composite, 1 S-Video, 1 Component video output
- 1 IR Emitter Input

**Standby power consumption**
- <0.5W

**Max power consumption**
- 651R: 1400W
- 751R: 1700W

**Dimensions - H x W x D**
- 651R: 150 x 430 x 420mm
- 751R: 150 x 430 x 420mm

**Weight**
- 651R: 17.4kg (38.3lbs)
